Acknowledgments

We are especially grateful to investigative journalist Joel Bleifuss. Joel's extensive writings, which appeared under his byline in *PR Watch* and *In These Times*, have been incorporated in these chapters: "Poisoning the Grassroots," "Silencing Spring" and "All the News That's Fit to Print."

Others whose research or writings have been incorporated in this book are Keith Ashdown, Jill Cashen, Ronnie Cummins, Rob Inerfeld and Peter Montague. Thanks to Liz Chilsen for permission to use portions from *Friends In Deed* in "The Torturers' Lobby." Thanks also for permission to incorporate material by Sheldon Rampton published previously in *Z Magazine* under the title, "Colombia: The Bosnia In Our Own Backyard."

We wish to express our gratitude to the staffs and boards of the following nonprofit foundations: CS Fund, Educational Foundation of America, Foundation for Deep Ecology, HKH Foundation, Ottinger Foundation, Florence and John Schumann Foundation, Stern Family Fund and Town Creek Foundation.

The following friends have provided support, ideas, encouragement and inspiration: Grant Abert, Greg Bates, Elva Barnes, Audrey Bedwell, Laura Berger, Eileen Cuncor, Mark Dowie, Carol Bernstein Ferry, William H. Ferry, Wade Greene, Cherrie Ivey, Linda Jameson, Kevin McCauley, Robert McChesney, Joe Mendelson, David Merritt, Alida Messinger, Dan Perkins, Renee Rampton, Scott Robbe, Debra Schwarze, Flic Shooter, John H. Staubler, Martin Teitel, Nancy Ward, Ken Whyte, Walda Wood and Winifred Woodmansee.

Also by Sheldon Rampton and John Stauber

Mad Cow USA: Could the Nightmare Happen Here?

"A chilling, revealing book about what really goes on behind the scenes in the meat industry. Every American family ought to read this book." —Jeremy Rifkin, author of *Beyond Beef: The Rise and Fall of the Cattle Culture*

INTRODUCTION

TORCHES OF LIBERTY

by Mark Dowie

On the surface it seemed like an ordinary publicity stunt for "female emancipation," the pre-Depression equivalent of women's liberation. A contingent of New York debutantes marched down Fifth Avenue in the 1929 Easter Parade, each openly lighting and smoking cigarettes. It was the first time in the memory of most Americans that any woman who wasn't a prostitute had been seen smoking in public.

It was dubbed the "torches of liberty contingent" by Edward Bernays, its brilliant behind-the-scenes organizer. Bernays, a nephew of Sigmund Freud, later admitted that he had been paid a tidy sum to orchestrate the march by George Washington Hill, president of the American Tobacco Company. But long before the public learned who had engineered the parade, it had achieved its goal of breaking the taboo against female smoking. Within months, in fact, the politest of American ladies were puffing in public and sales of Hill's Lucky Strikes were soaring.

The event is still hailed in public relations lore as a "triumph." Some people consider it *the* coup that launched a whole new, distinctively American industry.

Most of us are aware of public relations. "That's just a lot of PR," we say, with smug confidence that we have pierced the veil of hype around us rather than be taken in by some anonymous huckster. But few outside the public relations industry know how well PR

really works, and fewer still realize how often we are persuaded by it. Nor do many of us know how much of our "news" and other information originates from the desks of public relations practitioners. "The best PR is never noticed," says the proud unwritten slogan of the trade.

The sad truth, which this book amply documents, is that PR executives are today mediating public communications as never before. "Flacks" are no longer mere authors of press memos, "video news releases" and pre-packaged articles used by lazy reporters and editors. Nor are they simply "builders of bridges into prosperity . . . in a fly-by-night, flim-flam business," as theatrical publicist Ben Sonnenberg once described his chosen profession. That too we now accept about PR. But the intricate practice of relating to the public has evolved even further and requires the kind of close examination that John Stauber and Sheldon Rampton provide.

PR has become a communications medium in its own right, an industry designed to alter perception, reshape reality and manufacture consent. It is run by a fraternity carefully organized so that only insiders can observe their peers at work. Veteran PR professionals can read the front page of almost any newspaper in the country, or watch a segment of broadcast news and identify which of their peers "placed," "handled" or "massaged" a specific story—even which executives arranged the "placement," managed the "spin" or wrote the CEO's quotes. But can you or I? Or do we assume, as we are supposed to, that some dogged reporter, trained and determined to be the objective "eyes and ears of the public," set out to research, investigate and report his or her findings as accurately as possible?

This book is of particular interest to me as a journalist, not only because I spend so much of my time on the phone with "communications directors," "public information officers" and "community relations liaisons," but also because about a third of America's currently practicing PR men and women began their careers as journalists, where they learned how to investigate people and institutions, how newsrooms work and how to write a compelling and informative story. In a strange way many of them still *are* journalists. Academicians who study media now estimate that about 40% of all "news" flows virtually unedited from the public relations offices, prompting a prominent PR exec to boast that "the best PR ends up looking like news."

Also disconcerting is the fact that the 150,000 PR practitioners in the US outnumber the country's 130,000 reporters (and with the

media downsizing its newsrooms, the gap is widening). Furthermore, some of the country's best journalism schools now send more than half their graduates directly into public relations (an almost traitorous career choice to traditionalists like myself who instruct students how to handle PR executives and circumvent the barriers they erect between the truth and the story they want told about their clients).

With media becoming dependent on PR for more and more of its content, public relations executives have become inordinately powerful. Even the most energetic reporters know that they have to be somewhat deferential in the presence of a powerful publicist. No one on a national beat can afford to get on the wrong side of a Frank Mankiewicz or a Harold Burson knowing that their firms (Hill & Knowlton and Burson-Marsteller) together represent a third of the most quotable sources in the country.

People often equate public relations with the advertising industry, and in fact almost every major Madison Avenue agency, from J. Walter Thompson to Young & Rubicam, owns or is paired with a large PR firm. But PR firms carry out activities that are often considerably more secretive and sinister than designing clever slogans and video imagery. The modern "account" managed by a PR/advertising giant can now package a global campaign that includes a strategic blend of "paid media" (advertising) and "free media" (public relations). Add to that some of the other standard services offered by most PR firms—including "crisis management," industrial espionage, organized censorship and infiltration of civic and political groups—and you have a formidable combination of persuasive techniques available to large corporations and anyone else who can afford to hire the services of a PR firm. You know you're looking at propaganda when you open your newspaper and notice an ad for General Electric, but you're less likely to notice the rest of the mix—the story about GE that appears on page one, which may well have been placed by the same firm that placed the ad, and may in addition have deployed a private investigator to infiltrate and subvert the efforts of an activist organization attempting to combat GE's environmental practices. The independence of the press, already challenged by the influence of Madison Avenue, is now being further compromised by the interdependence of advertising and PR.

Corporations use the term "integrated communications" to describe this massive institutional meld, and its consequences are

profound. The methods of modern advertising, steeped in subliminal psychology and imagery aimed at the subconscious, have proven themselves effective at selling cars, mouthwash and cigarettes. Today similar methods are used almost reflexively to promote and protect ideas, policies, candidates, ideologies, tyrants and hazardous products. As propaganda, once the honorable purview of speechwriters, editorialists and orators, bypasses the conscious mind and is targeted at the subconscious, the consequences for culture, democracy and public health are staggering to contemplate.

As Stauber and Rampton clearly demonstrate in chapter after chapter of this book, a single public relations professional with access to media, a basic understanding of mass psychology and a fistful of dollars can unleash in society forces that make permanent winners out of otherwise-evident losers—whether they be products, politicians, corporations or ideas. This is an awesome power we give to an industry that gravitates to wealth, offers surplus power and influence to those who need it least, and operates largely beyond public view.

It is critical that consumers of media in democratic societies understand the origin of information and the process by which it is mediated, particularly when they are being deceived. Thus it is essential that they understand public relations. By offering between-the-lines analysis of PR's role in some of the most important stories of our time, this book leaves its readers with a much better sense of what is genuine. By deconstructing the modern triumphs of PR, it also shows how objective inquiry becomes subsumed by manufactured information, which either changes the public's perception of an event or the outcome of the event itself. In such an environment, facts cannot survive, nor can truth prevail.

Mark Dowie, a former publisher and editor of Mother Jones magazine, is the recipient of 14 major journalism awards, including an unprecedented three National Magazine awards.

CHAPTER ONE

BURNING Books BEFORE THEY'RE PRINTED

Who kills a Man kills a reasonable creature God's Image; but he who destroys a good Book kills reason itself—kills the Image of God.

JOHN MILTON
Areopagitica

All documents [redacted] are confidential [redacted] warned the September 7, 1990 memo from Betsy Gallickson, senior vice president at the giant Ketchum public relations firm. "Make sure that everything—even notes to yourself—are so stamped." Remember that we have a shredder [redacted] give documents to Lynette [redacted] for shredding. All conversations are confidential too. Please be careful talking in the halls [redacted] in elevators [redacted] in restaurants [redacted] etc. All suppliers must sign confidentiality agreements. If you are faxing documents to the client [redacted] another office [redacted] or to anyone else [redacted] call them to let them know that a fax is coming. If you are expecting a fax [redacted] you or your Account Coordinator should stand by the machine and wait for it. We don't want those documents lying around for anybody to pick up!"

Gallickson, a 1969 graduate of Northwestern University's prestigious Medill School of Journalism, understood perfectly the need for secrecy. If word leaked out, the media might have had a field day with Ketchum's plan to scuttle a groundbreaking environmental book even before it went to press.

The stakes were high for Ketchum's client, the California Raisin Advisory Board (CARAB), the business association of California raisin growers. In 1980, CARAB had scored big with a series of

clever TV commercials using the California Dancing Raisins. The singing, dancing raisins, animated through a technique known as claymation, were so popular that they had transcended their TV commercial origins. Fan mail addressed to the Raisins was forwarded to Ketchum along with phone inquiries from the media and people clamoring for live public performances. Ketchum obligingly supplied five costumed characters dressed as the Raisins who performed at the White House Easter Egg Roll and Christmas tree lighting, Macy's Thanksgiving Day Parade, and A Claymation Christmas Celebration on the CBS television network.

In the summer of 1988, the Raisins were sent out on a 27-city national tour, beginning in New York and ending in Los Angeles. Along the way, they performed in hotel lobbies, children's hospitals and convalescent centers and supermarkets. In several cities, they were greeted by the mayor and given keys to the city. They visited historic landmarks, singing and dancing their version of "I Heard It Through the Grapevine." They performed at a charity benefit honoring singer Ray Charles and his claymation counterpart, Kaison Ray. Over 3,000 people joined the California Dancing Raisins Fan Club and a research poll found that the Raisins were second in popularity only to comedian Bill Cosby.

For CALRAB, of course, the real payoff came in raisin sales, which increased 17 percent since the Dancing Raisins were first introduced. Behind the scenes, however, trouble was brewing, and Grunzen's secret memo outlined Ketchum's plan to manage the crisis.

The crisis was a science writer named David Steinman. In 1985, while working for the *LA Weekly*, Steinman had written a story about fish contaminated from toxic waste dumped near his home in the Santa Monica Bay area, and was shocked when a test of his own blood showed astromonomical levels of both DDT and PCBs. Steinman began piecing together links between these chemicals to higher rates of cancer and other diseases, and started wondering how many other persons were in the food chain. It started me asking why government officials, who had known about the dumping for years, had withheld the information for so long. In his search for the answers to these questions, Steinman began a five-year investigation, using the Freedom of Information Act to obtain obscure government research reports. Based on his research, he had written a book titled *Diet for a Poisoned Planet*, scheduled for publication in 1990.

Steinman's investigation had uncovered evidence showing that traces of toxic carcinogens and other contaminants (mostly

pesticides are found routinely in US foods from raisins to yogurt to beef. For example, government inspectors found raisins had 110 industrial chemical and pesticide residues in sixteen samples. *Diet for a Poisoned Planet* recommends that people avoid any but organically grown raisins raised without pesticides.¹

By compiling this information in book form, *Diet for a Poisoned Planet* enables readers to make safer food choices. But before shopkeepers can use the information, they must first hear about the book through media reviews and interviews with the author during a publicity campaign in the weeks after the book is published. And the California Raisin Advisory Board wanted to make sure that Steinman's book was dead on arrival.

PR firms, of course, are the experts at organizing publicity campaigns. So who better to launch an anti-publicity campaign to convince journalists to ignore Steinman and his book?

For Spies' Eyes Only

Our copy of Betsy Cullickson's memo came from an employee of Ketchum PR. Despite the risk of being fired, conscience drove this corporate whistleblower to reveal Ketchum's campaign aimed at convincing the possible health risks from high pesticide levels in California raisins and other foods.

I find it very discouraging when I read in the paper that cancer among children has increased dramatically and they don't know why, our source explained. I believe that people have the right to know about the little Dancing Raisins and the possibility that they might be harming children. There is a new censorship in this country based on nothing but dollars and cents.

According to the 1994 *O'Dwyer's Directory of PR Firms*, Ketchum is the sixth largest public relations company in the United States receiving net fees of over \$50 million per year. Headquartered in New York City, Ketchum represents a number of corporate food clients, including Dole Foods, Wendy's, the Potato Board, Oscar Mayer Foods, Miller Brewing, Kikkoman, H.J. Heinz, the Beet Industry Council, the California Almond Board, and the California Raisin Advisory Board. In addition to writing press releases and organizing news conferences, Ketchum aggressively markets its services in crisis management, a growing specialty within the PR industry. In a profile written for *O'Dwyer's PR Services Report*, Ketchum boasted of its experience handling PR problems ranging from toxic waste crises to low-level nuclear wastes, from community relations at Super

fand sites to scientific meetings where issues like toxicology of pesticides are reviewed.⁶⁵

Gullickson's PR expertise is in "food marketing strategic counsel" and Steinman's book is the type of "crisis" that she was hired to manage. Her memo outlined a plan to assign "broad areas of responsibility" such as "intelligence information gathering" to specific Ketchum employees and to Gary Obenauer of CALKAB. Months before the publication of *Diet for a Poisoned Planet*, Ketchum sought to obtain a copy of the book galley or manuscript and publisher's tour schedule. Gullickson recommended that spokespeople conduct one-on-one briefings interviews with the trade and general consumer media in the markets most acutely interested in the issue.

The Ketchum agency is currently attempting to get a tour schedule so that we can shadow Steinman's appearances. best scenario we will have our spokesman in town prior to or in conjunction with Steinman's appearances.⁶⁶

To get this information, Ketchum used an informant involved with the book's marketing campaign to tell them when and on which talk shows Steinman was booked. They called up each and every talk show "explained our source inside Ketchum. A list of media to receive low key phone inquiries regarding the Steinman book included specific journalists at the *New York Times*, the *Larry King Show*, and the *Washington Post*. The callers from Ketchum argued that it would be unfair to allow Steinman on the show without the other side of the issue, or tried to depict him as an "off the wall extremist without credibility."

Ketchum wasn't the only PR firm working to cripple Steinman's book publicity efforts. Jean Rainey of Edelman Public Relations contacted the *Todays Show*, providing anti-Steinman material and offering to make available the president of the American Dietetic Association to counter Steinman. Apparently she succeeded in boozing him from the program. *Todays* interviewed Steinman, but never aired the segment.⁶⁷

Government Moves to Suppress

Gullickson's memo also suggested possible "external ambassadors" who might be recruited into the campaign, including Republican California Governor Pete Wilson and Democratic Party fundraiser Tom Coelho. Thanks to a pesticide industry front group with deep Republican connections, the stealth campaign against Steinman's book even reached into the White House and other arms of the US government.

Elizabeth M. Whelan is a prominent anti-environmentalist who heads the American Council on Science and Health (ACSH), a group funded largely by the chemical industry. The ACSH is also a client of Ketchum PR. On July 12, 1990, Whelan wrote a letter to then-White House Chief of Staff John Sununu warning that Steinman and others "who specialize in terrifying consumers" were "threatening the US standard of living and indeed may pose a future threat to national security." Whelan's letter was copied to the heads of the government's Food and Drug Administration, Department of Agriculture, Department of Health and Human Services, Environmental Protection Agency, and the Surgeon General. Whelan also contacted her friend, former Surgeon General C. Everett Koop, whom she calls a "close colleague." Dr. Koop joined the attack against Steinman's book, calling it "trash" in a statement mailed nationwide.

In September 1990, before Steinman's book was published, the USDA initiated its anti-book campaign through the Agriculture Extension Service. The federally funded effort was led by government employees Kenneth Hull, Bonnie Polk, Cynthia Garman-Squier, and Janet Polley. According to a government memo, the Department of Agriculture group felt that "communications with the media by concerned parties have been effective in minimizing potential public concern about issues in the book." Attached to the memo is a "confidential analysis" of Steinman's book written by the National Food Processors Association, a food and pesticide trade group. The memo warns recipients that this information is "for internal use and should not be released to the news media."

Dr. William Marcus, who was then a senior science advisor to the US Environmental Protection Agency, wrote the introduction to *Diet for a Poisoned Planet*. Marcus' views were his own, but they greatly angered Whelan. She asked White House Chief of Staff Sununu to personally investigate the matter and exerted pressure to have the introduction removed from the book. Marcus refused, and was later fired from the EPA. Government policy has now been changed to prohibit offices from writing book forewords.

Deciding What You'll Swallow

You are probably going to eat some food today. It is possible—in fact, that you are—in the process of eating right now.

You have the right to eat. You have the right to eat whatever foods. You have the right to read, even while you are eating. You have the right to read about the foods you are about to eat. Neither

Ketchum Public Relations nor the White House has any right to interfere with your access to good food or good reading materials.

You have never voted for a politician who campaigned on a pledge that he would work to limit your access to information about the food you eat. You never voted for Ketchum PR, and if you are like most people you've never even heard of them. You never gave your consent for them to become involved in your life—and in return they have never bothered to ask for your consent. After all, they're not working for you. They're working for the California Raisin Advisory Board.

One of the most cherished freedoms in a democracy is the right to freely participate in the marketplace of ideas. We value this freedom because without it, all our other freedoms are impossible to defend. In a democracy every idea, no matter how absurd or offensive, is allowed to compete freely for our attention and acceptance. Turn on the TV and you'll find plenty of absurd and offensive examples of this principle in action. On the Sunday public affairs shows you'll find Republicans, Democrats, Republicans who love too much, and Democrats who love Republicans. On "A Current Affair" or Oprah Winfrey you'll find self-proclaimed werewolves, worshippers of Madonna, and doomsday prophets from the lunatic fringes of American society.

Unfortunately what you won't find can kill you.

Diet for a Poisoned Planet is a serious, important contribution to the public debate over health, the environment, and food safety. It fell victim to a PR campaign designed to prevent it from ever reaching the marketplace of ideas. And it isn't alone. Here are some other examples:

- In 1992 John Robbins was promoting his book *May All Be Fed*, which advocates a strict vegetarian diet. He became the target of an anti-book campaign by Morgan & Myers PR, working on behalf of the world's largest milk promotion group—the National Dairy Board. Based in Jefferson, Wisconsin, Morgan & Myers is the nation's 42nd largest PR firm, with about sixty employees and a 1993 net fee intake of \$3.7 million. With its field of specialization—representing agribusiness interests—Morgan & Myers ranks fifth in the United States. Its clients include Kraft, the Philip Morris subsidiary that buys and sells most of America's cheese; Upjohn, a major producer of antibiotics used on livestock; and Sandoz, a manufacturer of atrazine herbicide, a carcinogen that contaminates thousands of water wells.¹⁴

THIS MODERN WORLD

by Tom Tomorrow

IT'S TIME FOR YET ANOTHER LOOK AT HOW THE NEWS WORKS. STEP ONE: A CORPORATION WHICH HAS BEEN CAUGHT ENGAGING IN SOME ILLEGAL OR UNETHICAL ACTIVITIES Hires A PUBLIC RELATIONS FIRM...

AS WELL AS SENDING OUT SLICKLY-PRODUCED "VIDEO NEWS RELEASES" WHICH MANY CASH-STRAPPED LOCAL NEWS DEPARTMENTS AIR ENTIRELY UNEDITED...GIVING CORPORATE PROPAGANDA THE APPEARANCE OF OBJECTIVE REPORTING.

STEP TWO: THE PR FIRM PROCEEDS TO MANIPULATE PUBLIC OPINION IN A VARIETY OF DEvious, UNDERHANDED WAYS-- SUCH AS ANONYMOUSLY PLANTING OP-ED PIECES IN THE NATION'S NEWSPAPERS.

What's So Bad About Toxic Sludge?
by Joe Pundit

STEP THREE: PUBLIC OPINION IS SWAYED BY THIS ONSLAUGHT OF MEDIA MANIPULATION HAS OVERADING AS NEWS. SINCE AS PR FIRMS WELL UNDERSTAND, ANY LIE REPEATED OFTEN ENOUGH BECOMES TRUE...

As with Keter and California Raisins campaign, Morgan & Myers used behind-the-scenes contacts to undermine Robbins' publicity tour, thereby limiting his book's public exposure and readership. A Morgan & Myers memo of September 17, 1992 states that M&M ~~CONFIDENTIAL~~ is monitoring coverage of Robbins' media tour "...to counter his claims that he does not drink their consumption of dairy products." The memo was widely distributed to key dairy industry contacts. It contained the следованием of Robbins' book tour and provided this tactical warning: "Do not issue any news releases or statement. Doing so only calls attention to his message." Lofty PR response should come from a third party uninvolved in the dairy industry.

- The September 22, 1981 *Washington Post* reported that a single telephone call from a diligent public relations man to the Books of the Month Club can really do much in softening history of the

DuPont family and its businesses." The book by author Gerard Colby Zieg titled *DuPont Behind the Nylon Curtain* was a relentlessly critical exposé of the business and personal affairs of the wealthy DuPont family. After a copy of the manuscript found its way into the hands of the DuPonts, they deployed PR representative Harold G. Brown Jr. who phoned the Book of the Month Club editor to say that several people at DuPont considered the book "scandalous and actionable."

The Book of the Month Club had already contracted with Prentice Hall, the publisher, to feature *DuPont* as a November selection of its Fortune Book Club, but a few days after Brown's phone call the club called Prentice-Hall to back out of the deal. Apparently intimidated by the implied threat of a DuPont lawsuit, Prentice Hall made no effort to enforce its contract with the Book of the Month Club or to seek money damages. Instead the publisher reduced the book's press run from 15,000 to 10,000 copies and cut its advertising budget from \$15,000 to \$5,500 even though the book was getting favorable reviews in major publications. The *Los Angeles Times*, for example, called it "a vastly readable book and . . . a very important one." Peter Grenquist, president of Prentice Hall's trade book division, ordered the book's editor, Brim Cavan, not to discuss the matter with the author. In October, three months later, conscience finally drove Cavan to disobey Grenquist's order and inform the author of the phone call from DuPont. Cavan was later fired for being "unproductive."

- PR firms also campaigned against the book *Beyond Beef* by activist Jeremy Rifkin. *Beyond Beef* recommends that people stop eating beef for ethical, health and environmental reasons. Its message has been loudly denounced by both the Beef Council and the National Dairy Board, clients of Ketchum and Morgan & Myers respectively. Rifkin's enemies hired an infiltrator to pose as a volunteer in his office. The spy—Seymour "Bud" Vestermark whose infiltrations of other organizations are detailed in chapter 5 of this book—obtained Rifkin's book tour itinerary, after which all hell broke loose.¹⁷

In *The War Against The Greens*, author David Helvarg reports that Rifkin's spring 1992 national book tour had to be canceled after it was repeatedly sabotaged. Melinda Mullin, *Beyond Beef's* publicist at Dutton Books, says "radio and TV producers who'd

scheduled Rifkin's appearance began receiving calls from a woman claiming to be Mulan cancelling or misrepresenting Rifkin's plans. Finally, Mallin had to begin using a code name with the producers. Liz Embinder, a San Francisco-based radio producer who had had *Beyond Bechtel* on her desk for several weeks, was surprised to receive angry calls and an anonymous package denouncing Rifkin within hours of placing her first call to Mallin. This led to speculation that Dutton's New York phones might be tapped.¹⁸

Making the World Safe from Democracy

The public relations or PR industry did not even exist prior to the twentieth century, but it has grown steadily and appears poised for even more dramatic growth in the future. No one knows exactly how much money is spent each year in the United States on public relations, but \$10 billion is considered a conservative estimate. Publicity was once the work of carnival hawkers and penny-ante hustlers smoking cheap cigars and wearing cheap suits. Today's PR professionals are recruited from the ranks of former journalists, retired politicians and eager beaver college graduates anxious to rise in the corporate world. They hobnob internationally with corporate CEOs, senators and US presidents. They use sophisticated psychology, opinion polling and complex computer databases so refined that they can pinpoint the prevailing psychographies of individual city neighborhoods. Press agents used to rely on news releases and publicity stunts to attract attention for their clients. In today's electronic age, the PR industry uses 800 numbers and telemarketing, advanced databases, computer bulletin boards, simultaneous multi-location fax transmission and video news releases — entire news stories written, timed and produced by PR firms and transmitted by satellite feed to hundreds of TV stations around the world. Video news releases are designed to be indistinguishable from genuine news, and are typically used as "story segments" on TV news shows without any attribution or disclaimer indicating that they are in fact subtle paid advertisements. Most of what you see on TV is, in effect, a canned PR product. Most of what you read in the paper and see on television is not news, says a senior vice president with Gray & Company public relations.¹⁹

The PR industry also orchestrates many of the so-called "grass roots" citizen campaigns that lobby Washington, state and local governments. Unlike genuine grassroots movements, however, these

industry generated astroturf movements are controlled by the corporate interests that pay their bills. On behalf of the Philip Morris tobacco company for example, Benson Marsteller (the world's largest PR firm) created the National Smokers Alliance to mobilize smokers into a grassroots lobby for smokers' rights. Deceptive PR has become so cynical that sometimes it staggers belief. To fight former Attorney General Edwin Meese's Pornography Commission, *Playboy* and *Penthouse* magazines had Gray & Company PR create a front group called "Americans for Constitutional Freedom" to assist in countering the idea that those who opposed the commission's efforts were "motivated only by financial self-interest" or were "somehow pro-pornography." To delect environmentalists, PR firms have created green sounding front groups such as "The Global Climate Coalition" and the "British Columbia Forest Alliance."

In defense of these activities, the PR industry claims that it is simply participating in the democratic process and contributing to public debate. In reality, the industry carefully conceals most of its activities from public view. This invisibility is part of a deliberate strategy for manipulating public opinion and government policy. Persuasion by its definition is subtle, says another PR exec. "The best PR ends up looking like news. You never know when a PR agency is being effective. You'll just find your views slowly shifting."

Today's PR industry is related to democracy in the same way that prostitution is related to sex. When practiced voluntarily for love both can exemplify human communications at its best. When they are bought and sold however, they are transformed into something hidden and sordid. There is nothing wrong with many of the techniques used by the PR industry—lobbying, grassroots organizing, using the news media to put ideas before the public. As individuals we not only have the right to engage in these activities, we have a responsibility to participate in the decisions that shape our society and our lives. Ordinary citizens have the right to organize for social change—better working conditions, health care, fair prices for family farmers, safe food, freedom from toxins, etc., etc.—and a humane foreign policy. But ordinary citizens cannot afford the multimillion-dollar campaigns that PR firms undertake on behalf of their special interest clients—usually large corporations, business associations and governments. Raw money enables the PR industry to mobilize private detainees, attorneys, broadcast fixes, satellite feeds, sophisticated information systems and other expensive high-tech resources to outmaneuver ever-powerful and often true citizen initiatives.

Talking Back to the Flacks

Although the public relations industry is a twentieth century phenomenon, the art of influencing opinion has a long history, dating in fact to the days of ancient Athens, the first recorded western democracy. Aristotle's *Rhetoric* remains one of the most insightful books ever written on the subject. Aristotle argues that rhetoric is an art...as opposed to the sciences...which are governed by logic. The sciences deal with measurable quantities known facts and principles of proof based on propositions which can definitely be labeled "true" or "false." In social life, however, people are often confronted with situations in which many of the facts are unknown and unknowable. In addition, competing sectors within society have conflicting interests. It is often impossible to say for sure whether a proposition is "true" or "false," and scientific logic is incapable of evaluating statements whose degree of truth can only be approximated using concepts like "maybe," "probably" or "probably not." Instead of logic, therefore, people turn to *rhetoric*, the art of communication and persuasion.

Aristotle recognized that rhetoric could be used to mislead as well as to enlighten the public. Persuasive speakers could lead their audience into unwise choices. For this reason, he argued that rhetoric should be widely taught and understood so that the wise members of society would be able to contend effectively with the rhetoric of the unwise. Society would be best served if the public could choose from a range of contending arguments, and if people were trained in the skills necessary to recognize manipulative uses of rhetoric.

Aristotle's analysis is over 2,400 years old, but it offers the best solution that we have found to the problem of demagogery in our own age—the age of public relations. Today's opinion manipulation industry is a powerful giant, but like Goliath, it is a giant with a fatal weakness. When the public is educated about its techniques, it often loses its ability to mislead and manipulate. In Nevada, for example, Don Williams, president of Alterra Communications and widely known as a Nevada political king maker, attempted in 1992 to persuade the state to serve as a national storage site for nuclear waste. When the nuclear industry's PR activities were exposed in Nevada newspapers, public opinion turned decisively against the plan.

The founders of the American revolution argued that the price of freedom is eternal vigilance. Every man ought to exercise the faculties of his mind and think and examine for himself that he may be the less likely to be imposed on, and that he may temper his

accrue an opinion as possible of the measures of his ruler," wrote one farmer who campaigned against the British. Christopher Gadsden, another American revolutionary, argued that it was easier to stop the work of crafty dissembling insinuating men *before* rather than *after* they carry their point against you. "The price of democracy is the same today as it was in the days of Samuel Adams and Thomas Jefferson, and the PR industry is a haven for many of the crafty dissembling men we need to guard against."

The PR industry is a little like the title character in the 1933 Claude Rains movie, *The Invisible Man*. Rains plays an evil scientist who attempts to rule the world, committing crimes such as robbery and murder and using his invisibility to evade detection. *The Invisible Man* was an early special effects film, using hidden wires and other tricks to make ashtrays, guns, and other objects float in mid-air as though they were manipulated by an invisible hand.

Instead of ashtrays and guns, the PR industry seeks to manipulate public opinion and government policy. But it can only manipulate while it remains invisible.

We like to think of this book as the literary equivalent of a very big can of fluorescent orange spray paint. We're spray-painting the Invisible Man in order to make him visible again. We want the public at large to recognize the skilled propagandists of industry and government who are affecting public opinion and determining public policies while remaining out of public view.

In a democracy everyone needs to know who's really in charge, who makes the decisions, and in whose interest. Democracies function best without Invisible Men.

CHAPTER TWO

THE ART OF THE HUSTLE AND THE SCIENCE OF PROPAGANDA

A society is bound to be more dangerous if it is not governed openly by the people but secretly by political forces that are not widely known or understood.

ANDRII SAKHAROV

In 1850 legendary showman P.T. Barnum began his career by buying an old Negro slave woman named Joice Heth and exhibiting her to the public as George Washington's childhood nursemaid.

Joice Heth turned out to be 107 years old. Was she for real? The man who coined the phrase "there's a sucker born every minute" kept the public guessing through a clever series of forged letters to the editors of New York newspapers. Written by Barnum himself and signed by various fake names, some of the letters denigrated Barnum as a fraud. In other letters also written by Barnum, he praised himself as a good man who was performing a service by giving the public a chance to see George Washington's nanny. The letters succeeded in stirring up controversy. Joice Heth was discussed in news reports, the editorial columns, and the public flocked out in droves to see her themselves. Barnum collected as much as \$15.00 per week from New Yorkers who came to see the pipe-smoking old Negro woman.

When Joice Heth died, doctors performed an autopsy and estimated her to be around eighty. Barnum handled the situation like the PR pro that he was. He said he was shocked *deeply* shocked at the way this woman had recovered him.

Barnum knew that in his publicity for the greatest show on earth it didn't matter whether people called him a scoundrel or a saint. The important thing was that the newspapers spelled his name right and that they mentioned him often. He was one of the first people to manipulate the news for fun and profit.

The 1830s marked the beginnings of what we now call the "mass media" with the rise of "penny presses" such as the *New York Sun* which used low newsstand prices to draw in a large readership. Because of their larger circulation, they were able to charge enough for ads that advertisers rather than readers became their main source of income. This change also gave advertisers more power to influence the news and editorial sections. Newspapers offered "free press stories" to paying advertisers—a practice which is widely denied but still common today, especially in the business, food and automobile sections of newspapers.²

This transformation deepened as the years progressed. According to James Melvin Lee's *History of American Journalism*, it was possible by the end of the 19th century "to insert at a higher cost almost any advertisement disguised as a bit of news. Sometimes these paid reading notices of advertisers were distinctly marked by star or dagger, but more frequently there was no sign to indicate to the readers that the account had been bought and paid for and was not a regular news item."³

By disguising paid notices as news, companies tried to bypass readers' innate skepticism toward advertising. Then, as now, readers understood that advertisements were "propaganda" and they were more likely to believe a story if it seemed to come from an independent reporter.

The First Flacks

Before the public relations industry existed, companies employed press agents to feed advertisements and publicity to newspapers. Many early press agents worked for circuses, Broadway shows and other entertainment enterprises. Often they were recruited from the ranks of underpaid reporters looking for a way to earn more money. They used flattery, peaching and, of course, payments of money to grease the wheels for their clients' publicity. They were constantly scheming, desperate men, drifters and con artists with bad reputations, constantly scrabbling for clients and begging for favors. In 1911 writer W.C. Irwin described them as "the only group of men proud of being called liars."⁴

Like P. T. Barnum, the early press agents were more interested in generating publicity for their clients than in building images or reputations. The railroads, utility companies and big businesses like Standard Oil were just starting to learn that their profit margins could be affected by the public's opinion of them. When a reporter suggested that the New York Central Railroad should adjust its train schedules to accommodate the public, New York Central President William Vanderbilt angrily replied, "The public be damned." His remark provoked public outrage and attacks by the New York legislature forced him to sell off part of his railroad holdings.

At the turn of the century, social movements rose up to challenge the power of big business: the Grange movement, the Socialist Party, the Greenbackers, the Populists and Progressives. The labor movement was growing and radical agitators were urging exploited farmers to raise less corn and more hell. President Teddy Roosevelt coined the word "muckrakers" to describe the growing number of journalists who were dedicating themselves to exposing the corruption of business and government. William Randolph Hearst's newspapers attacked privilege, monopoly, corporate power and the panderbund of banks and trusts. The public be damned attitude of robber barons like Vanderbilt turned public opinion against the railroads, prompting Congress and state legislatures to enact over 2,000 laws affecting the industry between 1908 and 1913.¹⁵

Ivy Lee was one of the first consultants to offer the service of corporate image building. According to PR and story historian Scott Cutlip, Lee worked for J.P. Morgan's International Harvester Company to stave off antitrust action and later for the Pennsylvania Railroad which hired him in 1900 to take offensive measures as it were to place our case before the public. This led in turn to work as personal representative of railroad magnate E.H. Harriman. In 1911 Lee was hired, in course, to John D. Rockefeller Jr. The Rockefellers' family had become widely hated because of the ruthless monopolistic business tactics of their company, Standard Oil. Lee's widely circulated, incorrectly according to L.J. Ross, his former business partner, for advising John Sr. to scatter his money in a cold, simple tycoon by carrying a pocketful of dimes to give away to children whenever he was seen in public.¹⁶

Lee invented the public relations specialty that is today known as crisis management. His agents only put the best possible spin on a bad situation. At the time he went to work for the railroads, accidents were common and the railroad companies dealt with the

situation by withholding information and using bribes such as free railroad passes to suppress reports of accidents and their costs in lives and property. Lee had worked previously as a newspaper reporter and knew that this approach often invited suspicion and bad publicity. As an alternative he proposed an "open policy" of providing information to the press. Shortly after he went to work for the Pennsylvania Railroad a wreck occurred. Instead of trying to suppress the story Lee invited reporters to travel to the scene at the railroad's expense and set up facilities to assist them once they got there. Company executives thought Lee was crazy but they changed their minds after they discovered that his "open" strategy won them more favorable coverage than the old approach.¹

To advertise his policy of openness Lee distributed a "Declaration of Principles" to newspapers across the country which is often quoted today in public relations textbooks.

This is not a secret press bureau. All our work is done in the open. We aim to supply news. This is not an advertising agency. If you think any of our matter ought properly to go to your business office do not send. Our matter is accurate. Further details on my subject treated will be supplied promptly and any editor will be assisted most cheerfully in verifying directly any statement of fact. In fact our plan is frankly and openly on behalf of business concerns and public institutions to supply to the press and people of the United States prompt and accurate information concerning subjects which it is of value and interest to the public to know about.²

According to Cuthip Lee's approach to PR was not limited to putting the most favorable light on corporate activities. He saw himself as a counselor who shaped public opinion and advised companies how to "shape their affairs" so that "when placed before the public they will be approved." His standard prescription was "Set your house in order then tell the public what you have done so."

In practice however Cuthip admits this "two-way street" approach to public relations was limited by the fact that Lee's clients were engaged in activities that the public would never be likely to approve. In fact Lee's first job for the Rockefellers was to counter bad publicity following their brutal union busting tactics in the Ludlow Massacre in which Colorado state militia and company guards used machine guns to fire on a tent colony of striking mine workers killing women and children. Lee responded with a series of pro-Rockefeller bulletins titled "The Struggle in Colorado for Industrial Freedom". According to Ray Tuckern Lee's biographer "most of the bulletins

contained material which on the surface was true but which presented the facts in such a way as to give a total picture that was false.¹³

The Great War

The fledgling publicity industry got a big boost with World War I. Ivy Lee and many other industry promoters joined the US government's campaign to mobilize public opinion in support of the war effort. The Committee on Public Information, led by George Creel, used posters, billboards, advertising exhibits, pamphlets, and newspapers to promote the war to end all wars – to make the world safe for democracy.

In a history of the war effort titled *Mobilizing Civilian America*, Harold Ickes and Percy Baldwin describe the committee's work as perhaps the most effective job of large scale war propaganda which the world had ever witnessed. The committee bombarded the public unceasingly with enthusiastic reports on the nation's colossal war effort and with contrasts of our war aims and those of our allies with the war aims of the Central Powers. Dissenting voices were stilled either by agreement with the press or by the persuasive action of the agents of the Department of Justice.¹⁴ The committee recruited 75,000 civic leaders as "Four Minute Men" to deliver war messages to people in churches, theaters and civic groups. Ivy Lee's publicity program for the Red Cross helped it grow from 150,000 to 20 million members and raise \$100 million by the time the war ended. The Creel Committee also used the time tested tactic of feeding war the hysterical with artifice of city streets depicting the Germans as beasts and Huns.¹⁵

The war demonstrated the power of propaganda in helping build the reputations of Creel Committee members who returned to civilian life and offered their services to help business in the transition from a wartime to a peacetime economy. They applied and refined the publicity methods they learned during the war.

The postwar years saw Ivy Lee's firm defending the lockout miners again in a private war between coal mine owners and striking mine workers in West Virginia. Nearly 400,000 miners had gone out on strike to protest dangerous working conditions, low wages and other abuses such as payment of wages in company scrip that could only be used in overpriced company stores. The coal companies hired Ames Pinkerton detectives. President Warren G. Harding sent in federal troops. The governor of West Virginia ordered martial law. Logan County's corrupt sheriff, Don Chin, used money from the

coal companies to hire "deputy sheriff" strikebreakers. The resulting battles left at least 70 miners dead.

Ivy Lee worked to clean up the reputation of the coal companies by publishing bulletins titled *The Miner's Lamp and Coal Facts*. The bulletins ran stories praising the charitable works of mine owners and a first-hand sketch of Sheriff Don Chalm* which "reveals different traits than the public has been given to understand." They attacked the union's method of organizing and collecting dues, and claimed that company stores protect mine workers' pocketbooks.

These activities notwithstanding, Ivy Lee was the most widely sought-after advisor of his day to companies seeking to improve their public image. Many historians and industry insiders consider Lee the father of public relations—an honor he would probably hold without challenge if his reputation had not been tainted by scandal near the end of his career. In 1933, shortly after Adolf Hitler's rise to power, Lee's firm went to work for the German Dye Trust to advise them on ways to improve German-American relations, leading to charges that he was a Nazi propagandist. The *New York Mirror* ran a story in July 1934 headlined "Rockefeller Aide Nazi Mastermind." In November of that year, with the scandal still hanging over his head, Lee died of a brain tumor. An obituary in the *Jewish Daily Forward* described him as "an agent of the Nazi government."

Bernays and the "Engineering of Consent"

Ivy Lee's fall from grace enabled another early PR practitioner, Edward Bernays, to claim credit for founding the field of public relations. In his history of the PR industry, Scott Cutlip describes Bernays as "perhaps public relations' most fabulous and fascinating individual, a man who was bright, articulate to excess, and most of all, an innovative thinker and philosopher of this vocation that was in its infancy when he opened his office in New York in June 1919." Much of Bernays's reputation today stems from his persistent public relations campaign to build his own reputation as "America's No. 1 Publicist." During his active years, many of his peers in the industry were offended by Bernays' constant self-promotion. According to Cutlip, Bernays was a brilliant person who had a spectacular career, but to use an old fashioned word, he was a braggart.

Born in Vienna, Bernays was a nephew of Sigmund Freud, the father of psychoanalysis, and his public relations efforts helped popularize Freud's theories in the United States. Bernays also pioneered the PR industry's use of psychology and other social sciences

to design its public persuasion campaigns. If we understand the mechanism and motives of the group mind, it is now possible to control and regiment the masses according to our will without their knowing it," Bernays argued. He called this scientific technique of opinion-molding the "engineering of consent."

One of Bernays's favorite techniques for manipulating public opinion was the indirect use of third party authorities to plead for his clients' causes. If you can influence key leaders either with or without their conscious cooperation, you automatically influence the group which they sway, he said. In order to promote sales of bacon, for example, he conducted a survey of physicians and reported their recommendation that people eat hearty breakfasts. He sent the results of the survey to 5,000 physicians along with publicity touting bacon and eggs as a hearty breakfast. His clients included President Calvin Coolidge, Procter & Gamble, CBS, General Electric and Dodge Motors. Beyond his contributions to these famous and powerful clients, Bernays revolutionized public relations by combining traditional press agency with the techniques of psychology and sociology to create what one author called "the science of publicity."

When a person would first meet Bernays, noted writer Scott Cutlip, "it would not be long until Uncle Sigmund would be brought into the conversation. His relationship with Freud was always in the forefront of his thinking and his counseling. According to Irwin Ross, another writer, "Bernays liked to think of himself as a kind of psychiatrist to troubled corporations." In the early 1920s, Bernays arranged for the US publication of an English language translation of Freud's *General Introduction to Psychoanalysis*. In addition to publicizing Freud's ideas, Bernays used his association with Freud to establish his own reputation as a thinker and theorist—a reputation which was further enhanced when Bernays authored several landmark books of his own, most notably *Crystallizing Public Opinion* and *Propaganda*.²⁸

Bernays defined the profession of counselor in public relations as a "practicing social scientist whose "competence is like that of the industrial engineer, the management engineer, or the investment counsel, in their respective fields." To assist clients, PR counselors used "understanding of the behavioral sciences and applying them—sociology, social psychology, anthropology, history, etc."

This definition of PR was worlds apart from the old days of press agents and circus handbills. In *Propaganda*, his most important book, Bernays argued that the scientific manipulation of public opinion was

necessary to overcome chaos and conflict in society. The conscious and intelligent manipulation of the organized habits and opinions of the masses is an important element in democratic society. Those who manipulate this unseen mechanism of society constitute an invisible government which is the true ruling power of our country. We are governed, our minds are molded, our tastes formed, our ideas suggested, largely by men we have never heard of. This is a logical result of the way in which our democratic society is organized. A vast numbers of human beings must cooperate in this manner if they are to live together in a smoothly functioning society. In almost every act of our day lives whether in the sphere of politics or business in our social conduct or our ethical thinking, we are dominated by the relatively small number of persons who understand the mental processes and social patterns of the masses. It is they who pull the wires which control the public mind.

Compared to Ivy Lee's claim that all our work is done in the open, Bernays was refreshingly blunt about the secret manipulative nature of public relations work. His celebration of propaganda helped define public relations, but I didn't win the industry many friends. In a letter to President Franklin Roosevelt, Supreme Court Justice Felix Frankfurter described Bernays and Lee as "professional poisoners of the public mind, exploiters of foolishness, fanaticism and self-interest."²⁷ And history itself showed the flaw in Bernays' claim that manipulation of the masses is natural and necessary in a democratic society. The fascist rise to power in Germany demonstrated that propaganda could be used to subvert democracy as easily as it could be used to resolve conflict.²⁸

In his autobiography, Bernays recalls a dinner at his home in 1933 where Karl von Weizsäcker, foreign correspondent of the *Heil* newspaper, an old hand at interpreting Europe and just returned from Germany, was telling us that Goebbels and his propaganda teams to consolidate Nazi power. Goebbels had shown Weizsäcker his propaganda library, the best Weizsäcker had ever seen. Goebbels said Weizsäcker was using my book *Crystallizing Public Opinion* as a basis for his destructive campaign against the Jews of Germany. This shocked me. Obviously the attack on the Jews of Germany was not an unbridled outburst of the Nazis, but a deliberate planned campaign.²⁹

CHAPTER THREE

Smokers' Hacks

"I tell you why I like the cigarette business. It costs a penny to make a Schlotter's cigar. It's idiotic. And there's fantastic brand loyalty."

WARREN BUFFETT
one of R.J. Reynolds's largest shareholders

One of the PR industry's first major clients was the tobacco industry. In the early twentieth century, the tobacco companies used PR's psychological marketing skills to first hook women and then entice them in their droves. Edward Bernays, Ivy Lee, and John Hill all worked on PR for tobacco, pioneering techniques that today remain the PR industry's stock in trade—third-party advocacy, subliminal message reinforcement, junk science, phony front groups, advocacy advertising, and buying favorable news reporting with advertising dollars.

Prior to World War I, smoking cigarettes was considered unfeminine for women and effeminate for men, who either smoked cigars or stuck to tobacco of the chewing variety. The war brought cigarettes into vogue for men, and during the Roaring Twenties, the American Tobacco Company turned to PR to develop a vast new market—American women. It was one of its Lucky Strike brand. The company first hired ad man AD Tasker, who portrayed Lucky Strikes as a healthy cigarette by concocting surveys using spurious data to claim that doctors preferred Luckies as the "less irritating" brand. Tasker also developed an advertising campaign featuring female Metropolitan opera stars, their soprano voices somehow unaffected by smoking, giving testimonies such as "Cigarettes Are Kind to Your Throat" and "I Protect My Precious Voice With Lucky Strikes."

Edward Bernays was hired by Liggett & Myers, the maker of Chesterfields, to spoof their rivals at American Tobacco. Bernays

created an organization called the "Tobacco Society for Voice Culture" to establish a home for singers and actors whose voices have cracked under the strain of their cigarette testimonials. The satire was successful enough that American Tobacco President George Washington Hill fired Bernays away from Liggett & Myers. Some time later, Bernays learned that Hill had also hired Ivy Lee's PR firm a year earlier. When Bernays asked Hill about this, he replied: "If I have both of you, my competitors can't get either of you."

To persuade women that cigarette smoking could help them stay beautiful, Bernays developed a campaign based on the slogan "Reach for a Lucky instead of a Sweet." The campaign played on women's worries about their weight and increased Lucky sales three-fold in just twelve months. (The message—cigarettes keep you thin—reverberates today in the brand name Virginia Slims.)⁴

But smoking remained a taboo for respectable women, and Bernays turned to psychoanalyst A.A. Brill for advice. Brill provided a classic Freudian analysis:

Some women regard cigarettes as symbols of freedom. Smoking is a fulfillment of oral eroticism: holding a cigarette in the mouth excites the oral zone. It is perfectly normal for women to want to smoke cigarettes. Early on the first women who smoked probably had an excess of masculine components and adopted the habit as a masculine act. But today the castration of women has suppressed many of the feminine desires. More women now do the same work as men do. Cigarettes, which are equated with men, become torches of freedom.⁵

Brill's analysis inspired Bernays to stage a legendary publicity event that is still taught as a model in PR schools. To sell cigarettes as a symbol of women's liberation, he arranged for attractive debutantes to march in New York's prominent Easter parade, each waving a lit cigarette and proclaiming it a "torch of liberty." Bernays made sure that publicity photos of his smoking models appeared worldwide.⁶

Decades of saturation cigarette advertising and promotion continued into the 1950s via billboards, magazines, movies, TV and radio. Thanks to Bernays and other early pioneers of public relations, cigarettes built a marketing juggernaut upon an unshakable identification with sex, youth, vitality and freedom. The work for the tobacco industry, in turn, earned PR widespread credibility and launched the rise of today's multi-billion dollar public relations industry.

The Truth Hurts

In the early 1950s the first scientific studies documenting tobacco's role in cancer and other fatal illnesses began to appear. In 1952 *Reader's Digest* ran an influential article titled "Cancer by the Cigarette." A 1953 report by Dr. Ernst L. Wynder detailed to the scientific community a definitive link between cigarette smoking and cancer. Over the next two years dozens of articles appeared in the *New York Times* and other major public publications. *Good Housekeeping*, the *New Yorker*, *Look*, *Woman's Home Companion*. Sales of cigarettes went into an unusual, sudden decline.

The tobacco czars were in a panic. Internal memos from the industry-funded Tobacco Institute refer to the PR fallout from this scientific discovery as the "1954 emergency." Fighting desperately for its economic life, the tobacco industry launched what must be considered the costliest, longest-running and most successful PR crisis management campaign in history. In the words of the industry itself, the campaign was aimed at "protecting cigarettes and protecting them from these and other attacks" by creating doubt about the health charge without actually denying it, and advertising the pleasure of smoking without actually urging them to take up the practice.

For help, the tobacco industry turned to John Ebb, the founder of the PR megadom Hill & Knowlton. Hill designed a brilliant and expensive campaign that the tobacco industry is still using today in its fight to save itself from public rejection and governmental action. Ebb is remembered today as a shrewd but ethical businessman. In a letter he once stated: "It is not the work of public relations...to outsmart the American public by helping management build profits. Yet Ebb's work to save tobacco in the 1950s is such an egregious example of outsmarting the American public...to build profits, that Hill & Knowlton is still in court today answering criminal charges." The company's role is described as follows in a 1993 lawsuit, *State of Mississippi vs. the Tobacco Cartel*:

As a result of these efforts, the Tobacco Institute became known as the Hill & Knowlton entity later known as The Council for Tobacco Research (CTR) was formed.

The CTR, formerly known as the Cigarette Research Council, has promoted, through the 100 newspapers funded by the CTR, "Truth About Smoking," a "Truth Statement to Cigarette Smokers," and advertisements for participating tobacco companies, that "smoking is probably the principal cause of lung cancer and probably one of the causes of heart disease, but smoking does not cause cancer or heart disease."

The participating tobacco companies also promised to cooperate closely with public health officials.

After this beginning, turn the public into a false sense of security concerning smoking and health, the Tobacco Industry Research Committee continued to act as a front for tobacco industry interests. Despite the initial public statements and posturing and the repeated assertions that they were committed to full disclosure and wholly concerned, the TIRC did not make the public health a primary concern. In fact there was a coordinated industry wide strategy designed actively to mislead and confuse the public about the true dangers associated with smoking cigarettes. Rather than work for the good of the public health as it had promised, and sponsor independent research, the tobacco companies and consultants acting through the tobacco trade association refuted, undermined, and neutralized information coming from the scientific and medical community.

Smoke and Mirrors

To improve its credibility, the TIRC hired Dr. Clarence Little as director. Previously, Little had served as managing director of the American Society for the Control of Cancer, forerunner to today's American Cancer Society. Little promised that if research did discover a direct relationship between smoking and cancer, the next job tackled will be to determine how to eliminate the danger from tobacco. This pretense of honest concern from a respected figure worked its expected magic. Opinion research by Hill & Knowlton showed that only 2% of the news experts expressing opinions on the TIRC were unfavorable, whereas 63% were favorable without reservation.

There is no question that the tobacco industry knew what scientists were learning about tobacco. The TIRC maintained a library with cross-indexed medical and scientific papers from 2500 medical journals, as well as press clippings, government reports and other documents. The employees called this library for scientific data with inconclusive or contrary results regarding tobacco and the harm to humans health. These were compiled into a carefully selected 18-page booklet titled *A Scientific Perspective on the Cigarette Controversy*, which was mailed to over 200,000 people, including doctors, members of Congress and the news media.

During the 1950s, tobacco companies more than doubled their advertising budgets, going from \$76 million in 1953 to \$122 million in 1957. The TIRC spent another \$978 [5] in 1954 alone, of which one tenth went to Hill & Knowlton, another tenth went to pay for dividends, and most of the remainder went to administrative costs.

Despite TIRC's promise to sponsor independent research—only \$80,000 or less than 10% of the total budget for the year, actually went to scientific projects.¹²

In 1963 the TIRC changed its name to the Council for Tobacco Research. In addition to this "scientific" council, Hill & Knowlton helped set up a separate PR and lobbying organization—the Tobacco Institute. Formed in 1958, the Tobacco Institute grew by 1990 into what the *Public Relations Journal* described as one of the most formidable public relations lobbying machines in history—spending an estimated \$20 million a year and employing 120 PR professionals to fight the combined forces of the Surgeon General of the United States, the National Cancer Institute, the American Cancer Society, the American Heart Association and the American Lung Association.¹³

The tobacco industry's PR strategy has been described by the American Cancer Society as "a delaying action to mislead the public into believing that no change in smoking habits is indicated from existing statistical and pathological evidence."¹⁴ In the 1990s, medical studies estimated that 400,000 of the 50 million smokers in the United States were dying each year from tobacco related diseases, and that smoking was likely to be a contributing factor in the deaths of half the smokers in the country.¹⁵ Tobacco opponents lobbied for public education and strict new regulations to prevent youthful addiction and to protect the public's right to a smoke free environment. But despite smoking's bad press, tobacco profits have continued to soar—and the industry is opening new, unregulated mega-markets in Asia, Eastern Europe and the Third World.¹⁶ Even in the US, most attempts at serious federal or state regulation or taxation are swatted down by tobacco's skilled army of highly paid lobbyists.

Snatching Victory from the Ashes

One way the cigarette industry intends to keep winning is by escalating to unprecedented levels its use of front groups such as the "National Smokers Alliance," an ambitious and well funded grass roots campaign developed by Burson Marsteller PR with millions of dollars from Philip Morris.

The National Smokers Alliance (NSA) is a state-of-the-art campaign that uses full page newspaper ads, direct telemarketing, paid canvassers, free 800 numbers and newsletters to bring thousands of smokers into its ranks each week. By 1995 NSA claimed a membership of 3 million smokers. The campaign's goal is to rile up and mobilize a committed cadre of foot soldiers in a grassroots army

directed by Philip Morris's political operatives at Burson-Marsteller. Philip Morris knows that to win politically it has to turn out the troops—people who can emotionally battle on its behalf. The NSA is a sophisticated, camouflaged campaign that organizes tobacco's victims to protect tobacco's profits.

In the past the tobacco industry attempted not too convincingly to distance itself from pro-smoking forces. The Tobacco Institute's Bernarr Dawson told the *Congressional Quarterly* in 1990: "If we were to fund smokers' rights groups and bring them to Washington wouldn't they then be viewed as an arm of the tobacco industry?"

Apparently desperate times require more obvious measures. In 1994, *National Journal* writer Peter Stone observed that NSA is increasingly looking like a subsidiary of Burson-Marsteller—and noted that the PR firm uses its grassroots lobbying unit, the Advocacy Communications Team, to start building membership in the group last year. Thomas Humber, a Burson-Marsteller vice-president, is president and CEO of the NSA. Burson executives Kenneth Feitz and Pierre Salinger are active, as is Peter G. Kelly, a prominent Democrat with the firm of Black Manafort Stone & Kelly, which is owned by Burson-Marsteller.¹⁷

How does the NSA recruit smoking's victims into becoming its advocates? Through a combination of high-tech direct marketing techniques and old fashioned "feet in the street" community organizing. Like every good grassroots group, the National Smokers Alliance has a lobby but student newsletter for its membership, called *The NSA Voice*. According to its fine 1994 issue, the NSA pays hundreds of young activists to sign up members in bars and bowling alleys in cities around the country. Eric Schippers, in charge of the membership drive, reported that, during only the first two months of activity, the Chicago campaign put 180 recruits on the street and recruited more than 11,000 members.

Many NSA members are first recruited via full-page ads with 800 numbers that exhort smokers to stand up for their rights. Everyone who calls receives the NSA newsletter free for three months, along with 10 membership recruitment cards and stickers to place in stores and restaurants that say "I am a smoker and have spent \$____ in your establishment." NSA members who sign up another ten people at www.nsa.org win a free NSA T-shirt. The committed and informed pro-smoking advocate can also call a free 800 number to order more sign-up cards and stickers, or get the latest marching orders regarding which businesses or politicians need nudging from Multibucks

masses. One recent NSA mailing sent first class to hundreds of thousands of smokers urged them to write letters to the Occupational Safety and Health Administration (OSHA) to defeat new regulations that would "ban smoking in any site where work is conducted."

Burson Marsteller's propagandists have even coined a clever play on words that questions the patriotism of anti-smokers by calling them "anti-Americans." NSA's newsletter advises "If Anti-America is pushing a discriminatory smoking ban in your workplace, speak up" and "check the laws in your state with regard to the protection of individual rights."¹⁰

Bringing in the Sheaves

In recent years California has been the front line of the tobacco wars and the state where the industry has suffered its worst setbacks. In 1988 the cigarette companies spent more than \$20 million in a failed effort to defeat a major anti-smoking initiative. Since then health activists have passed hundreds of local smoking bans. As a result California has seen a 27% decrease in cigarette consumption—the most success of any state in reducing tobacco's deadly toll.

Philip Morris is fighting back through a California PR firm called the Dolphin Group. Dolphin CEO Lee Stitzenberger used a half-million dollars from Philip Morris to set up a front group called "Californians for Statewide Smoking Restrictions." Using this deceptive name, NSA members gathered signatures to put a referendum on the California ballot in November 1994 which the Dolphin Group promoted with billboards reading "Yes on 188—Tough Statewide Smoking Restrictions—The Right Choice."

In reality, Proposition 188 was a protobacco referendum which, if passed, would have undermined 270 existing local antismoking ordinances in California cities, as well as the state's new statewide smoke-free workplace law. Anti-smoking groups charged that many of the people who signed petitions in favor of the referendum were led to believe that they were supporting a measure to protect non-smokers and youths. After the public learned about the funding source behind "Californians for Statewide Smoking Restrictions," opinion turned decisively against the referendum and it was voted down. The \$25 million smokescreen the tobacco industry created to dupe Californians into voting for Proposition 188 has cleared and the voters have spoken, declared the American Cancer Society.¹¹

The tobacco industry's PR campaign is not just about swaying public opinion, a battle which the industry has already lost. Even

but of smokers favor stricter government regulation of their deadly habit. The industry's goal is not to win good PR but to avoid losing political and legal battles. This survivalist strategy has served the cigarette industry well for forty years. At a PR seminar in May 1994 Tom LaMia, the chief lobbyist for the Tobacco Institute, pointed out that tobacco sales continue to grow worldwide. He dismissed tobacco critics as simply a "political correctness craze" and ridiculed predictions of tobacco's demise, saying that the media has been preparing smoking's obituary for decades. Tobacco may be fighting for its life, but LaMia reminded the assembled PR practitioners that his industry has been fighting and winning that battle for a long time.

Hazy Ethics

Sixteen thousand PR practitioners (including Harold Benson and Lee Stitzenberger) belong to the Public Relations Society of America (PRSA) and pledge to abide by its seventeen point "Code of Professional Standards." The code states that a PRSA member shall conduct his or her professional work in accord with the public interest:

PR legend Edward Bernays, who designed the torches of liberty parade that made smoking socially acceptable for American women later said if he'd known of the dangers of tobacco he would have refused the account. When the profession of public relations was first outlined, Bernays stated, it was envisioned as either professions functioning that is, as an art applied to a science—in this case social science—and in which the primary motivation was the public interest and not pecuniary motivation. No reputable public relations organization would today accept a cigarette account since their cancer-causing effects have been proven.

These ethical qualms in his later years made Bernays a lonely voice within the public relations industry. In 1993 an online survey of 48 PR firms revealed that only nine would even accept it to represent the tobacco industry.

Bernays, a nonsmoker, lived to be 103 years old, passing away in March 1995. His final years were spent fruitlessly appealing to the PRSA to police its own ranks. Under present conditions, a unethical person can sign the code of PRSA, become a member, practice unethical PR—unreined by any legal sanctions. Bernays observed: "In law and medicine such an individual is subject to censure from the profession. There are no standards. This sad situation makes it possible for anyone, regardless of education or ethics, to use the term 'public relations' to describe his or her function."

CHAPTER FOUR

SPINNING THE ATOM

Once thought to be shared by all mankind, including myself, the risk proliferation of nuclear power plants is now one of the biggest clouds hanging over America. Production of capabilities to produce nuclear weapons of mass destruction is reaching terrifying proportions. And now the prospect of the reprocessing or recycling of nuclear wastes from scores of atomic power plants is close upon us.

DR. DAVID LITFENTHAL

physicist, Nobel prize winner, and first chairman
of the US Atomic Energy Commission

As part of Edward Bernays' incessant effort to create a "professional" image for public relations, he proposed creating an informal social forum where public relations professionals could mingle and share ideas with top leaders in business and government. To get the group started, he organized a dinner at his home in January 1948 with university professors, journalists, business leaders, and other PR professionals as invited guests. He followed up by sending a memo about the dinner to *Time* magazine, which ran a story in its January 24 issue: "Around a dinner table in Manhattan frequently gather some 20 of the top propagandists in the U.S. This unpublished high-powered group calls itself the Council on Public Opinion. Chairman is the Nation's No. 1 publicist, Clark Mchaniel, in Edward L. Bernays."

This small group might be the seat of a sinister super-government were it not that no two members of the Council on Public Opinion completely agree on anything very important.

Indeed, disagreements quickly led to a shake-up within the group. The self-serving reference to Bernays as "the Nation's No. 1 publicist" offended Hill & Knowlton founder John Hill, who complained

that Bernays' press release had depicted him as 'sitting at the feet of the master to learn public relations'. Hill organized a monthly dinner and social forum of his own to which Bernays was not invited. At a meeting hosted by the PR director of Bethlehem Steel, a member joked that after our pilgrimage to Bethlehem they should call themselves 'the Wisemen'. The name stuck and the Wisemen have been meeting ever since an elite group of high-level practitioners who regularly discuss social, economic and political trends.

Near the end of World War II, the US government turned to the Wisemen for advice on how to handle publicity aspects of the top-secret Manhattan Project to develop the atomic bomb. With government security men guarding the doors, the Wisemen met with Major General Leslie Groves, chief of the Manhattan Project, at the University Club in New York City. Groves briefed them on the atomic development and asked for advice on how to handle PR for the first tests in New Mexico. At their suggestion, the War Department invited *New York Times* reporter Bill Lawrence to observe the tests and to be the 'pool reporter' relaying information from the bombings of Japan to other reporters the Army had assembled in Manila.

The end of the war left the US with a new set of public relations concerns related to the bomb. The US monopoly on nuclear weapons quickly evaporated as the Soviet Union developed bombs of its own. By 1952 both countries had graduated from A bombs to H bombs yielding more than 15,000 times the destructive power of the explosion that obliterated Hiroshima. As US-Soviet hostilities hardened, the public was left to consider the horrifying potential that atomic power had unleashed—the prospect that the next world war could involve bombs capable of destroying whole cities in a war that even then people realized no one would win.¹

Atoms for Peace

In 1953 President Dwight Eisenhower delivered his now-famous 'Atoms for Peace' speech to the United Nations. Using a swords-into-plowshares approach borrowed from the Bible, he pledged that peaceful power from atomic energy is no dream of the future. That capability already proved is here—now today—ready to "provide abundant electrical energy in the power-starved areas of the world."

The US pledges "to help solve the fearful atomic dilemma—to devote its entire heart and mind to find the way by which the miraculous inventiveness of man shall not be dedicated to his death but consecrated to his life."²

that Bernays' press release had depicted him as "sitting at the feet of the master to whom public relations" (He organized a monthly dinner and social forum of his own, to which Bernays was not invited). At a meeting hosted by the PR director of Bethlehem Steel, a member joked that after their pilgrimage to Bethlehem they should call themselves "the Wisemen." The name stuck, and the Wisemen have been meeting ever since—an elite group of high-level practitioners who regularly discuss social, economic and political trends.

Near the end of World War II, the US government turned to the Wisemen for advice on how to handle publicity aspects of the top-secret Manhattan Project to develop the atomic bomb. With government security men guarding the doors, the Wisemen met with Major General Leslie Groves, chief of the Manhattan Project, at the University Club in New York City. Groves briefed them on the atomic development and asked for advice on how to handle PR for the first tests in New Mexico. At their suggestion, the War Department invited *New York Times* reporter Bill Lawrence to observe the tests and to be the "pool reporter" relaying information from the bombings of Japan to other reporters the Army had assembled in Manila.

The end of the war left the US with a new set of public relations concerns related to the bomb. The US monopoly on nuclear weapons quickly evaporated as the Soviet Union developed bombs of its own. By 1952 both countries had graduated from A bombs to H bombs yielding more than 15,000 times the destructive power of the explosion that obliterated Hiroshima. As US-Soviet hostilities hardened, the public was left to consider the horrifying potential that atomic power had unleashed—the prospect that the next world war could involve bombs capable of destroying whole cities in a war that even then people realized no one would win.

Atoms for Peace

In 1953 President Dwight Eisenhower delivered his now famous "Atoms for Peace" speech to the United Nations. Using a swords-into-plowshares approach borrowed from the Bible, he pledged that peaceful power from atomic energy is no dream of the future. That capability already proved is here—now today—ready to provide abundant electrical energy in the power-starved areas of the world.

The US pledges "to help solve the fearful atomic dilemma—to devote its entire heart and mind to find the way by which the miraculous inventiveness of man shall not be dedicated to his death but consecrated to his life."¹¹

Eisenhower's speech marked the beginning of a public relations campaign to transform the image of nuclear technology. Previously its sole proven use had been for the purpose of designing destructive weapons. Now the US Atomic Energy Commission (AEC) promised that nuclear generators would make electricity 'too cheap to meter'. The government's monopoly on ownership of nuclear materials was abolished, and private companies were invited to participate in the commercial development of atomic energy. The US promised to share atomic energy technology with underdeveloped nations. The atom's image as a magical source of unlimited energy was promoted using educational films, brochures and experts who promised that a lump of uranium the size of a pea could unleash enough energy to drive a car to the moon and back less than a year following his 'Atoms for Peace' speech. Eisenhower appeared on national television to personally lead a publicity stunt on Labor Day of 1954. Waving a 'magic wand' he electronically signalled a radio-controlled bulldozer to begin breaking ground at the small Pennsylvania town of Shippingport marking the start of construction on the country's first commercial nuclear power plant.

Once again, however, image and reality were worlds apart. Although scientists had already demonstrated the possibility of using nuclear reactors to generate electricity, the technology had little support among US utility companies who saw nuclear generators as expensive and unnecessary. In fact, the cost per kilowatt of electricity generated by the Shippingport reactor was ten times higher than the prevailing cost of power. Federal subsidies were necessary to make it commercially competitive with conventional coal-powered reactors.¹ The true purpose of Shippingport was symbolic – it sent a message that the atom could be harnessed for peaceful uses.

In 1956 David Lilienthal had resigned as AEC chairman. He became increasingly disillusioned with the many instances of the way in which public relations techniques – the not so hidden persuader – have been used to promote the appropriate technologies for the peaceful Atom. He criticized the elaborate ritual of providing nuclear technology to underdeveloped countries. Even as a propaganda move it was self defeating and untrue. A great many of these countries need and could use doctors and medicine, storage batteries, plows and fertilizers and seed – not good elementary scientific instruction. Only the desire to prove somehow that atoms were for peace could justify the absurdity of a separate program, not in the foreign aid part of the State Department but in the AEC.

By 1962 nuclear power was still more expensive than energy generated by conventional means, but the AEC and private companies such as Westinghouse, Union Carbide and General Electric had spent billions of dollars in research and development and they were anxious to see a return on their investment. With great fanfare, GE announced in 1962 that it had contracted to build a nuclear plant at Oyster Creek, New Jersey, for \$91 million, entirely *without* federal subsidy. In reality, however, the Oyster Creek reactor was a "loss leader." General Electric built it at a bargain basement price, accepting a loss on the deal so it could position itself to dominate the reactor market. The ploy worked. The mystique of high-tech atomic power proved hypnotic, and orders for new reactors began rolling in from utility companies convinced that they needed nuclear power to remain on the cutting edge of America's energy future. As the orders came in, GE discreetly jacked up its prices, until utility companies were actually paying *more* for the privilege of "buying into the future" than if they had stayed with conventional generators.

Damage Control

As the rhetoric of power "too cheap to meter" faded, the AEC and nuclear advocates spoke instead of someday producing atomic electricity that would be competitive in cost to coal, gas or hydroelectric power. This goal was never achieved in practice. But even if nuclear power could be produced at a competitive price, the technology had another major problem: safety.

At a conventional power plant, an accident or sabotage might kill a few dozen people, a couple of hundred in a worst-case scenario. By contrast, a 1957 study by the Brookhaven National Laboratory estimated that a "worst case" accident at a small 15-megawatt nuclear reactor 30 miles upwind of a major city would kill 3,400 people, injure another 43,000, and cause \$7 billion in property damage. An accident at a larger, 1,000-megawatt reactor could kill as many as 65,000 people, cause property damage of nearly \$30 billion, and radioactively contaminate an area the size of the state of Pennsylvania. These estimates stunned the AEC steering committee which had commissioned the study. In an internal memorandum, steering committee member S. Alan Lough wrote that "Great care should be exercised . . . to avoid establishing and/or reinforcing the popular notion that reactors are unsafe. Though this is a public information or promotional problem that the AEC now faces with less than desirable success, I feel that by calculating the consequences of

hypothetical accidents, the AEC should not place itself in the position of making the location of reactors near urban areas nearly indefensible. The steering committee decided to withhold publication of the Brookhaven study, and when word of its existence leaked out, the AEC responded by saying only that it had never been completed.¹¹

In fact, the industry had already seen a series of catastrophic accidents, most of which were successfully kept out of the press. As the years unrolled, new accidents kept happening.

- In Kyshtym in the Soviet Union, a massive radioactive explosion at a high-level waste dump in 1957 rendered an area of over 70 square miles permanently uninhabitable.
- At the SL-1 test reactor in Idaho, an exploding fuel rod killed three reactor operators and saturated the reactor building with radiation. Three weeks after the January 3, 1961 accident, the hands and heads of the three victims were still so hot with radiation that they had to be severed from their bodies and buried separately as radioactive waste.¹²
- On October 5, 1966, a partial meltdown at the 300-megawatt Enrico Fermi 1 fast-breeder reactor at Monroe, Michigan prompted utility officials to seriously consider the possibility of having to evacuate Detroit, 40 miles to the north. News of the accident was successfully withheld from the public until the early 1970s, when John G. Fuller, one of the engineers who witnessed the meltdown, published a book titled *We Almost Lost Detroit*.¹³
- In 1975, fire damaged electrical cables and safety systems at the Tennessee Valley Authority's Browns Ferry complex in Alabama. The fire triggered near panic in the plant's control room and started a process that could, if allowed to continue, have led to a meltdown.¹⁴

Containment Failure

Despite aggressive publicity efforts, the nuclear industry was never able to overcome its association with the nuclear weapons industry. The movement against nuclear power originated with the campaign against above-ground bomb testing, which educated citizens about the health and environmental dangers posed by radiation. Environmental concerns also fed the first real opposition to the building of nuclear power stations, when the Sierra Club in 1961 opposed construction of the Bodega Head plant near San Francisco on a site that was not only part of a locust infestation reserve, but also on an easily erode-

fact—the activism of the 1960s led rapidly to growing protests linking nuclear power to nuclear bombs, and by the late 1970s, no-nuke groups were active throughout the United States lobbying and developing information programs which criticized the nuclear industry on environmental, safety, and economic grounds.

In response, electrical utilities stepped up their PR campaigns. A 1978 survey of business funded educational materials in US public schools showed that more than any industry group, the electric utilities provide extensive multi media materials on energy issues. These energy education efforts notably target the elementary grade levels through the use of comic books, cartoon graphics or simple phrasing. This emphasis on the lower grades seems aimed at cultivating a future constituency in support of the electric power industry in general and nuclear power in particular. The educational cartoon books include titles such as *The Atom Electricity and You* distributed by the Commonwealth Edison Company for A Limited Audience Only, published by Westinghouse, and *Mickey Mouse and Goofy Explore Energy*, produced by Exxon.

The PR campaign attempted to portray nuclear power as not only safe but environmentally cleaner than other power sources. In *The Story of Electricity* published in 1975 by the Florida Power and Light Corporation, comic book characters proposed that nuclear plants are clean, odorless and generate electricity economically—and most important help conserve fossil fuels. Another comic book titled *The Battle for Survival—The War Against Environmental Pollution* published by Virginia Electric and Power claimed that nuclear generating stations are "about the cleanest and most desirable neighbor that my community can have...and our power company is a leader in constructing these new plants."

Despite decades of efforts to generate favorable publicity, the nuclear industry was strikingly unprepared to handle the image crisis that erupted in Pennsylvania on March 28, 1979, when control systems failed at the Three Mile Island facility. According to Robert Dierschneider, the E&L & Knowlton PR executive who was brought in to manage the crisis, "The miscommunication at Three Mile Island was the most monumental I have ever witnessed in business and reflected a crisis of epic proportions." By way of bad luck, public opinion was being swayed by the erroneously coincidental series of events at Three Mile Island to the point of recently released *the award-winning movie, "The Chernobyl Syndrome," which portrayed a culture completely more concerned with corporate profits and cover-ups than*

with serious safety problems. Metropolitan Edison, the company managing Three Mile Island for parent company General Public Utilities, seemed to be reading from the same script as the movie in its initial response to the discovery that its reactor was overheating.

The first rule of effective public relations in a crisis is to announce the bad news as completely and quickly as possible. Metropolitan Edison broke this rule in the first day of the crisis by attempting to evade the facts and downplay the extent of radiation released from the ailing reactor. Worse yet, Met Ed's public relations staff gave out contradictory and inaccurate information. "There have been no recordings of any significant levels of radiation and none are expected outside the plant," said Met Ed's chief spokesman, Don Curry. Shortly after this statement was released, Pennsylvania's Department of Environmental Resources sent a helicopter over the plant with a geiger counter and detected radiation. Company officials backpedaled and said they didn't know *how much* radiation had been released. Later that afternoon, they changed their position again and said the release was minor. Company vice president Jack Hertzlein became the perfect target for skeptical journalists talking in technical jargon and losing his temper with reporters. When someone asked what might happen if the hydrogen bubble inside the reactor came in contact with a spark, he answered that the result could be "spontaneous energetic disassembly" of the reactor. When reporters asked him to explain the difference between "spontaneous energetic disassembly" and an explosion, he angrily refused to answer further questions.²¹

Alarmed by the utility company's refusal or inability to explain what was happening inside the plant, Pennsylvania Governor Richard Thornburgh suggested that pregnant women and children leave an area within a five-mile radius of the plant. Panic followed. Forty-nine percent of the population living within fifteen miles of the plant—14,000 people—picked up and fled. The photographs in the press were appalling. Displaced citizens crowded. They resembled refugee lines in World War II. People were living off bottled water and canned food. There was no exodus. They packed their cars and their campers with everything they could and jammed the highways. Babies bundled in blankets, kids with scarves wrapped across their faces to limit their exposure to the radiation, and pregnant women in sheer panic about the future they might be facing.

Following the accident, opinion polls registered a sharp drop in public support for nuclear power and the nuclear industry.

responded with a multi-million-dollar media blitz. Teams of utility executives spread across the country to hold press conferences and appear on TV talk shows. Pro-nuclear advertisements were placed in magazines aimed at women readers. Videotapes of experts discussing technical aspects of nuclear power were distributed free to TV stations, and information packets were sent to the print media. An industry funded Nuclear Energy Education Day was organized on October 18, 1979, with over 1,000 sponsored events, including a brunch for congressional wives in Washington and a joggers' mass relay race in California. When Jane Fonda and Tom Hayden went on an anti-nuclear speaking tour, the industry sent out two nuclear engineers as a "truth squad" to follow them and refute their arguments.¹

In reality, however, the nuclear power industry was in decline even before Three Mile Island. Between 1970 and 1980, the price for building a new reactor had quintupled. The nuclear industry complained that legal challenges and delays from anti-nuclear citizens were responsible for many of the cost increases. Rising costs led utility companies to cancel their plans to build new reactors. The last order for a nuclear power plant was placed in 1978. In 1981, at least half a dozen nuclear power plants under construction were canceled as the industry realized that it was cheaper to let them sit unused and incomplete than to try to finish and operate them.² The 1986 meltdown of the Russian nuclear plant at Chernobyl which spewed radioactive contamination over Europe and around the globe seemed to mark the final nail in the coffin of an already dying technology, born of hype and deception.

Waste Not Want Not

The radioactive waste from nuclear power plants contains the deadliest substances known. It consists mostly of spent fuel which, although it is no longer suitable for generating power, will remain radioactive and lethal for over 100,000 years. At the government's Hanford, Washington, test reactor in the late 1940s, engineers used remote-controlled machinery to remove radioactive waste, put it into heavy containers, and bury it in the ground near Hanford. This crude method has remained the basic model for disposal ever since, despite promises by experts that science will find a way to dispose of it safely.

Since the late 1980s, deep underground geologic disposal has been proposed as a means to isolate the used highly radioactive fuel for the thousands of years necessary. Several exploratory efforts to

locite repository sites in salt beds buried deep beneath Ohio, Michigan and New York were halted when state and local officials discovered the work being done by the AEC and objected. By the 1980s growing quantities of nuclear waste had become the ultimate hot potato. Everyone—including critics of the industry—agreed that the stuff needed to be stored somewhere but nobody wanted it anywhere near where they lived.

In 1986 the Department of Energy announced that it had narrowed the locations under consideration to three sites in Nevada, Texas and Washington state. The governors of all three states responded immediately with lawsuits challenging the decision. In 1987 Texas and Washington were eliminated from consideration leaving Yucca Mountain, Nevada, as the only remaining candidate. Located about 100 miles north of Las Vegas, Yucca Mountain is a barren ridge of compressed volcanic ash. Government scientists stated that nuclear waste could be buried there in underground tunnels with minimal risks to public health or the environment, but Nevada residents remained unconvinced. Surveys showed that Nevadans opposed the Yucca Mountain repository by a 4-to-1 margin.

In January 1991 the American Nuclear Energy Council (ANEC) began funding the Nevada Initiative in an effort to change public opinion. Designers of the Nevada Initiative included Kent Orm, a key advisor to Nevada Governor Bob Miller; Ed Allison, a longtime Nevada Republican political operative; and Don Williams, a political campaign consultant and lobbyist who had worked for numerous state politicians from both parties. Using militaryargon, the plan proposed a series of TV ads to provide "air cover" for the repository plan. Local reporters were to be lined up to present the industry's side of the story to their peers. Kent Orm trained scientists from the Department of Energy to act as a scientific truth response team to keep protesters off the repository. The goal of the campaign, according to the plan, was to "reduce the public's concerns over safety. Once public sentiment swings, the next phase of the campaign will focus on the merits of nuclear energy." Without campaign committee of Nevada political leaders, our strategic response teams, the advertising program, and the press that will provide us a road map along the way, we believe that is even more so true. One or more of the targeted adversaries will begin to surface now, halfway lights and then eventually drag me with the industry. It is through this strategy of the chess that the campaign will ultimately prevail and move to checkmate all nuclear forces in Nevada.

The planners warned however that the campaign has a formidable goal. It took Nevadans a lifetime to build up fears and resentments regarding nuclear energy. Countering the amount of free press against nuclear such as accidents at Three Mile Island and Chernobyl hazardous leaks and various other plant problems along with science fiction movies would literally cost tens of millions of dollars in terms of column inches and air time in Nevada alone. Across the country the cost would run into the billions.²²

In October 1991, the Nevada Initiative began its first massive barrage of 'air cover' ads. Narrated by Ron Vito, a popular former sportscaster the ads attempted to demonstrate the safety of transporting high level nuclear waste. One advertisement showed a truck and trailer bearing a cask of nuclear waste being rammed at high speed by a train to show that nuclear waste casks could safely survive such a collision. Other ads featured DOE scientists explaining that nuclear waste would not explode or claiming that living near a nuclear power plant would not cause cancer.

Nevada political officials at all levels have been extremely aggressive in opposition to the project explained a letter dated October 25, 1991 from Florida Power President Allen J. Keesler to other members of the Edison Electric Institute, a US association of electrical utility companies. They have effectively frustrated DOE's efforts to move forward. Sustained progress on the Yucca Mountain program can only be achieved by developing a cooperative environment in Nevada. To fund the PR campaign Keesler asked each utility engaged in nuclear energy production to pay a special assessment collected through a special billing included with EEI's dues. Keesler's letter closed by reminding recipients that this document is *Confidential*. You can understand the sensitivity associated with it becoming public.²³

In November three weeks into the advertising campaign industry funded posters conducted a survey and reported that although 72% of Nevada residents had seen the ads the results were not encouraging:

Fewer than 15 percent of the respondents who had seen the ads said they now made them more supportive of the repository while 42 percent said the messages made them less supportive. Despite the barrage of pro repository messages almost three quarters of the respondents (73%) said they would oppose the repository if they were to vote on whether it should be built. Almost exactly the same proportion as before the ad campaign. Almost half (48.5%) of the

respondents who had seen the advertisements said they did not believe the ads — while 33 percent felt misled by the ads — and 11.8 percent disagreed with the ads for a variety of reasons.²⁰ These three categories of negative comments make up 43 percent of the recorded responses.²¹

A few weeks later the campaign hit another even worse snag. One of the nuclear utility executives who had received Alan Keesler's confidential letter decided to leak it to anti-nuclear forces along with other key documents detailing the industry's PR strategy. The documents proved highly embarrassing. In testimony before the Nevada Commission on Nuclear Projects, ANGC vice president Ed Davis had claimed that the purpose of the advertising campaign was strictly "to inform and educate the public." Newspapers and television coverage contrasted his statement with the campaign's internal documents which talked of bringing pressure on the state of Nevada to cooperate with the program and hiring local reporters to present the industry's side of the stories and "convince the public that nuclear energy is safe."²²

Nevadans reacted with outrage. Newspapers and television coverage featured scathing attacks by state officials that continued for weeks. Nevada Senator Richard Bryan demanded an explanation from Energy Secretary James Watkins regarding the role of his department in the PR campaign. Governor Bob Miller wrote the governors of other states with nuclear power plants challenging the propriety of using utility ratepayer funds to persuade Nevadans that they ought to accept nuclear wastes that no other state wanted.²³

The PR campaign's central themes are captured in a report titled "The Nevada Initiative: A Key Communication Issue" by James Flynn, Pam Sloane and C.K. Meier, employees of an opinion polling firm named Decision Research.

Perhaps the most leveraging response to the ANGC campaign came from a pair of Las Vegas skiers who became proudly one of the new TV ads' primary characters. First, a skier who mockingly told the viewer, "What do you expect? Promotional events were funded with your tax dollars," was asked to repeat his slogan, "I expect the best," several times.

Then he was asked to sit in a TV chair and answer a few questions about his attitude toward nuclear energy. When Meier asked him whether he would vote for ANG's initiative, the skier responded that he may not have known enough about it by putting one thumb in the air and the other in the down position. He was asked to name an ANGC ad. After a few moments of thought, he pointed to one of ANGC's most effective ads, the one featuring

cement will hit by a speeding train and dropped from a high tower. You can be sure that it's one high quality tomato.

The ANGC campaign faced with disbelief, ridicule, and little measurable influence on public opinion was discontinued. By that time, the campaign's credibility had been damaged considerably. A survey conducted in June 1992 by researchers from Arizona State University and the University of Nevada, Las Vegas showed that after seeing the ads only 33 percent of respondents reported an increased level of trust in the repository program while almost 11 percent were less trusting and the remainder were unchanged.¹

In April 1991 former Secretary of Energy James Watkins created a task force to analyze the critical institutional question of how the Department of Energy (DOE) might strengthen public trust and confidence in the civilian radioactive waste management program. After two years of public meetings and hearing formal presentations from more than 100 organization representatives the task force concluded that "distrust [in DOE's activities] is not irrational." Moreover, "this distrust will continue for a long time will require sustained commitments from successive Secretaries of Energy to overcome and will demand that DOE act in ways that are unnecessary for organizations that have sustained trust and confidence."

During the task force hearings participants made repeated references to the public relations tactics of the nuclear industry. DOE found itself in the unfortunate position of being blamed for these activities as well as their own. The huge sums of money paid to PR operatives of the nuclear industry had left a legacy that was not only unsuccessful in molding public opinion but permanently harmful to the industry's image.

Nukem

The combination of public opposition and management problems within the Department of Energy led to repeated postponements of the anticipated completion date for the Yucca Mountain repository. On average, in fact, every year the date was pushed back by two years, making for what the Decision Research team described as an extremely slow moving program. Combined with funding shortfalls, questions about the ability to meet regulatory requirements, and a history of inadequate management of the scientific work, the program often appears on the verge of collapse.

With the date for completion of a permanent storage site postponed until sometime in the 21st century the industry has been forced to fall back on a "temporary" plan—storing spent fuel locally

in the yards of power plants across the country. A strategy for dealing with this latest embarrassment is contained in an industry published article titled "The Public Relations Bceland Nuclear Waste." It begins: "So...the necessity of keeping spent fuel in dry casks and in the yards of power plants is adding yet one more blemish on the face of the nuclear industry, is it? Not when good PR is used. Many utilities across the United States are finding that public relations campaigns, when launched well in advance of dry cask installation, are turning potentially negative situations into positive ones.... Make no mistake about it. All the public relations in the world will never cause the public to greet radioactive waste with open arms. But for those utilities running out of pool space, a smart PR program will make them better equipped to temper the tempest and to get the public thinking about waste in a more scientific way."

The article appeared in the March 1985 issue of the *Nukem Market Report*, published by Nukem Inc. of Stamford, Connecticut. Described by the *New York Times* as "infamously tainted," Nukem Inc. is a subsidiary of the German corporation Nukem GmbH. Apparently in German, the name doesn't carry quite the same negative connotations as it does in English. I vaguely aware that its name is a bit of a PR problem, the American subsidiary has tried various typographical strategies to encourage people to place the emphasis on the second syllable when pronouncing Nukem—sometimes spelling it, for example, with the "k" of the first three letters capitalized, i.e., "Nukem" or "NuKEM."

Nukem GmbH designs and operates waste treatment systems for the chemical and nuclear power industries. In December 1987, the company's nuclear shipping and temporary storage license was revoked after it was disclosed that some 2,000 barrels of nuclear waste had been illegally shipped into West Germany from Belgium and stored without proper identification. The company was investigated following charges by German police in Vöcker Hünfeld that Nukem had sold fissile materials to Libya and Pakistan in violation of the Nuclear Nonproliferation Treaty. The charges were never proven, but the scandal led to the suspension of top Nukem executives Kurt Gerhard Hackstein and Peter Leneck Link. Like its parent corporation American Nukem is engaged in the business of commercial waste management—but its primary activity is buying and running dry casks for sale to nuclear power plants.

According to the *Nukem Market Report*, honesty, openness and cooperation are the PR tools with which utility companies can

persuade their next door neighbors, local government and business leaders, and environmentalists to tolerate nuclear waste. As an example of openness, it advises utility companies to conduct plant tours, meet with local elected officials, and communicate their point of view to plant employees since neighbors tend to ask plant workers for the "inside scoop" on what's really going on. The Nukem strategy also attempts to enlist moderate anti-nuclear groups in support of selected goals of local power companies. In Michigan, for example, the Consumers Power Company made a presentation to the moderate group West Michigan Environmental Action Council, and succeeded in persuading the council to focus more on getting the material out of the state of Michigan and to Yucca Mountain rather than bemoaning the fact that *The waste is here.*

As an example of cooperation, Nukem praises the Baltimore Gas & Electric Company for paying its employees to donate one hour each week for public service activities in their community. As a result, BGE employees serve in senior positions in local volunteer fire companies and have adopted a total of three elementary schools for mentoring and tutoring programs. Over 100 employees are coordinating about 50 charities including the United Way, Multiple Sclerosis, Muscular Dystrophy, and March of Dimes fundraising drives. By cultivating a caring community minded image, BGE has been able to limit opposition to its dry cask proposal. The key, says BGE Public Information Officer Karl Neidinger, is to build this image early. "As long as ten years before a utility even thinks about a dry storage facility, it had better have developed a good community image."¹⁵

These innocuous sounding activities in state-of-the-art PR reflect the industry's sophisticated understanding of the techniques necessary to sway public opinion in today's cynical world. During the 50 years since the detonation of the first atom bomb, public opinion has steadily become more suspicious of nuclear power, despite the work of the powerful well-financed nuclear lobby. The David Yucca Mountain campaign in Nevada is one dramatic examples showing that the powers that be in today's society need more than spin, cover-up, advertising and manipulation of the mass media to own public acceptance. Troops are also needed to fight the "ground war" for public opinion. In order to fight that war, the PR industry has studied the tactics of grassroots democracy used by environmentalists and other citizen activists, and it has begun to adopt and use these tactics for its own purposes.

CHAPTER FIVE

Spies for Hire

The military is a role model for the business world.

ROBERT DILENSCHNEIDER
ex CEO of Hill & Knowlton Public Relations

"Bud" looked the part of a B movie detective: a huge, hulking man in his late 50s, pushing 270 pounds with pale skin, a military haircut, sweaty palms and fidgety manners. He almost always wore the same cheap dark blue suit and carried a large leather briefcase.

For years Bud was a frequent visitor to the offices and events of nonprofit public advocacy groups, particularly those involved in environmental, food safety and animal welfare issues. Sometimes he said he was a freelance writer, sometimes just a concerned citizen.

One day Bud showed up at a press conference organized by the Beyond Beef campaign to persuade consumers that they should eat less meat for health and environmental reasons. A reporter thought he recognized Bud and went over to say hello. "How are you doing?" the reporter asked. "Are you still working for McDonald's?"

"I don't know what you're talking about," Bud said, fidgeting. "Sorry," the reporter said, perplexed. "We've met before. You used to work for McDonald's."

"You have me confused with someone else," Bud said, shifting nervously.

The incident raised suspicions and members of the Beyond Beef campaign decided they ought to learn a little bit more about Bud. A Beyond Beef staffer followed Bud leaving their headquarters and took him to the office of the secretive PR public affairs firm of Mongoven, Biscoe and Duchin (MBD). When activists reported company president Jack Mongoven denied that Bud was an employee, but an

MBD secretary admitted that Bud often visited the office. Inquiring messages left on Bud's home phone machine went unanswered.

Public Policy and Private Eyes

Movements for social and political reform have often become targets of surveillance. In the early days of the labor movement, businesses used private detective agencies to infiltrate trade unions. In the 1920s and during the Cold War, the government spied on Communists and suspected fellow-travelers. In the 1960s, the FBI and local police investigated civil rights demonstrators and anti-war protesters. The Watergate scandal leading to the resignation of President Nixon began when White House staff members organized illegal espionage of Nixon's political opponents. Revelations of these activities provoked public outrage and led Congress to pass laws restricting the government's right to spy on law-abiding citizens.

In the private sector, however, spying is relatively unrestricted. The federal civil rights act, for instance, applies merely to government action. "What's amazing about private surveillance is that there is no legal protection against it," says Philadelphia lawyer David Kairys.

"Public police are accountable," says sociologist Gary L. Marx. "They have to, in principle, make a case for their actions in open court and the accused has a right to challenge and oppose evidence. Also, they're restricted by the exclusionary rule and the entrapment doctrine, but private systems of justice don't have to contend with those. We've always thought a big brotherian government is a threat to liberty, but the framers of the Constitution didn't pay much attention to private groups because there weren't large corporations at the time. With the rise of malfunctions, there is a powerful third force."

In fact, government agencies sometimes encourage the private sector in activities that the government itself is forbidden from carrying out. In 1987, for example, administrators of US government research agencies met with a lobbyist for the private biomedical researchers to develop a strategy for fighting the growing animal rights campaign against animal testing. "The stakes are enormous," stated a memo circulated at the meeting by Frederick K. Goodwin, one of the participating federal officials. The memo went on to outline a strategy for keeping the government behind the scenes while encouraging private groups to undermine the animal rights movement. "Wherever feasible, the research institutions should move the cost front activities to the other groups.... Agencies should find some acceptable way to provide funding for some of these efforts and technical

support for others. Interviewed later, Goodwin explained the reasoning behind his strategy: "We're not allowed to lobby. There's a law against it. But all federal agencies have linkages to various advocacy groups interested in the business of that agency."

The public relations industry has developed a lucrative side business scrutinizing the thoughts and actions of citizen activists, using paid spies who are often recruited from government, military or private security backgrounds. Take, for example, Bud, the mole inside the Beyond Beef campaign. Bud's real name was Seymour D. Vestermark Jr. Before becoming a PR spy, he began his career path as an Army analyst for the Department of Defense, writing reports such as *Vulnerabilities of Society to Nuclear Attacks: Studies of the Social Dimensions of Nuclear Attack*, which laid out approaches for determining the likely social effects of nuclear attack, in order to plan for post-war reorganization and shorter-term and longer-term recovery. He went on to work in the executive office of the president of the United States, staffing a task force on political assassinations and collective violence. On March 27, 1976, he was mentioned briefly in a *New York Times* article describing a State Department conference on international terrorism. In 1978, he co-authored a book titled *Controlling Crime in the School* to help high school principals grapple with problems such as: how to use intelligence information for good police relations; the dilemma created by the bomb threat; the proper use of surveillance photography; extremists and their threatening scenarios; developing mass arrest procedures; and "why kids take cops."

Flacks and Spooks at the Watergate Hotel

In addition to domestic espionage, the PR industry has been linked repeatedly to overseas spying, often lending its overseas offices to serve as CIA front groups. Some of these links are explored in *The Power House*. Susan R. Friend's after biography of PR executive Robert Keith Gray Friend reports that the 2001 Hill & Knowlton, friend decided to open overseas offices — on the advice of friends including then-CIA director Allen W. Dulles. According to Hill & Knowlton executive Robert L. Crowley, Hill & Knowlton's overseas offices were perfect cover for the ever-expanding CIA. Unlike other cover jobs being a public relations specialist did not require technical training for CIA agents. George Warden, another company executive said he "used to kid at Hill & Knowlton about our office in Kuala Lumpur because nobody would tell me what it did, and I swore it had to be a CIA front."²⁴

Another PR firm with CIA links, Robert R. Mullen & Co., played a key role in the Watergate scandal. A report on the scandal by Howard Baker, the Republican vice-chairman for the Watergate committee states that Mullen & Co. maintained a relationship with the Central Intelligence Agency since its incorporation in 1959. It provided cover for an agent in Europe and an agent in the Far East at the time of the Watergate break-in. In addition to fronting for the CIA, Mullen provided public relations services for clients including the Mormon Church, General Foods, and the US Department of Health, Education and Welfare.

In 1971 the Mullen firm was purchased by Robert F. Bennett, the son of Wallace Bennett, Utah's conservative Republican senator. Robert Bennett figures prominently in a lengthy analysis of the Watergate affair by J. Anthony Lukas published in the January 4, 1976 *New York Times Magazine*. "Robert Foster Bennett is one of the most intriguing figures in the Watergate saga," Lukas writes. "Through his political ally, Chuck Colson, he maintained close relations with the Committee to Re-elect the President.... And in early 1971 through Colson's good offices he purchased Robert R. Mullen & Company, a Washington public relations firm which served as a CIA front in Stockholm, Singapore, Amsterdam and Mexico City, provided cover for some CIA activities in this country, and hired a whole platoon of former CIA men—among them Howard Hunt."

The day after Hunt's retirement from the CIA on April 30, 1970, he went to work for the Mullen Co. As the presidential election campaign was gearing up, Colson called Bennett in July 1971 and arranged to have Hunt moonlight for the White House. The Mullen Co.'s offices were located at 1700 Pennsylvania Ave., directly across the street from the offices of the Committee to Re-elect the President at 1701 Pennsylvania, and the Nixon campaign planned many of its dirty tricks, including the Watergate burglary, in Hunt's office at the Mullen Co.¹²

The day after Hunt's accomplices were arrested at the Watergate hotel, a Mullen Co. attorney helped the burglars make bail. Subsequent investigations showed other connections between the Mullen firm and the Watergate conspiracy, including a series of phone calls from Hunt's office to Donald Segretti, who was later convicted for directing a campaign of political espionage and sabotage against the Democrats. In fact, several prominent journalists investigating the Watergate affair, including Lukas, came to the conclusion that Mullen CEO Robert Bennett was Deep Throat, the mysterious secret

informant who leaked Watergate information to *Washington Post* journalists Bob Woodward and Carl Bernstein. According to Senator Howard Baker's Watergate report, "Bennett was feeding stories to Bob Woodward who was suitably grateful . . . he was making no attribution to Bennett and . . . he was protecting Bennett and Mulren and Company." According to Watergate defendant Chuck Colson, "Bennett was the key figure in the CIA's efforts to cover up its own role in Watergate and to blame the whole thing on the White House." By positioning himself as an information source rather than a target of the Watergate investigation, Bennett survived the scandal with his reputation intact, and in 1992 Utah voters elected him to his father's old seat in the US Senate.

The Nestlé Crunch

In 1977, a church-based group of activists became concerned about the Swiss-based Nestle corporation and its deadly practice of selling infant formula to women in Third World countries to stimulate sales. Nestle gave away free infant formula to hospitals along with educational materials, instructing women to use the formula to feed their newborns. Use of the free formula interrupted women's lactation process, preventing their breasts from producing enough milk and obliging them to buy formula once the samples ran out. In the Third World, many people lack access to clean water, and poor people often cannot afford to buy sufficient formula. Women who were induced to use Nestle formula in place of breast milk often had no choice but to dilute the formula with contaminated water, leading to diarrhea, dehydration and death, among Third World infants.

Activists opposed to this practice originally planned a six-month publicity campaign around the issue, but Nestle's hostile response backfired and prompted a protest boycott of the company's products. Eventually over 700 charities and activist groups world wide joined the boycott.¹⁶

After three years of a losing confrontation, Nestle tried a different approach beginning in 1981 with the formation of the Nestle Coordination Center for Nutrition (NCCN). Nestle's chief strategists were Rafael Pagan and Jack Mengiven. Before entering the private sector, Pagan had been a military careerist whose work included political and economic briefings at the White House, a tour of duty at the Pentagon, and various missions to Latin America. Mengiven was a communist before turning to peasant work as a Republican party organizer, followed by work in the communications office of the

Nixon and Ford administrations. Although Mongoven did not have a military background he had studied military strategy and found it useful in planning political campaigns. He and Pagan bonded on their first day together when Mongoven listed the nine principles of German military theorist Carl von Clausewitz during a strategy planning meeting. In developing their campaign they also turned to Sun Tzu's classic theoretical work, *The Art of War*.

Pagan and Mongoven conducted an in-depth analysis of the coalition supporting the boycott and developed a divide and conquer strategy. Some of the boycott's strongest support came from teachers represented by the National Education Association, so NCN courted support for Nestle from the American Federation of Teachers, a smaller more conservative rival union. To counter the churches involved in the boycott they needed to find a strong church that would take their side. The United Methodists were supporting the boycott but through negotiations and piecemeal concessions Nestle gradually succeeded in winning them over. They NCN helped establish the Nestle Infant Formula Audit Commission (NIAC), an independent group chaired by former US Secretary of State Edmund S. Muskie for the purpose of monitoring Nestle's compliance with the World Health Organization's policies on marketing of breast milk substitutes. Although NIAC was organized by Nestle NCN carefully selected educators, clergy and scientists including boycott supporters whose service on the commission would create a perception of legitimacy, objectivity and fairness.

It took years but this strategy of appeasement and image manipulation gradually dampedened the ties of outrage. In January 1984 the International Nestle Boycott Committee announced that they were ending the boycott. In 1986 Nestle's infant formula marketing practices prompted renewed concern, but this time the company was ready. They hired Ogivvy and Mather Public Relations to develop a strategy called "protective neutralization" which included plans to monitor Nestle's critics, an analysis of various church leaders and organizations to gauge how strongly they would support the boycott and suggestions for winning over wavering boycott supporters. John Kelly, a BBC reporter who discovered the Ogivvy and Mather plan described it as "an open and shut case of a spy plan".

The end of the boycott taught Nestle boycott left Retic Pagan and Dick Mongoven with reputations as PR master workers and a database of information about activist organizations. During the Nestle campaign they had developed classes on groups such the Inter-

National Organization of Consumer Unions and the Pesticide Action Network along with clergy and labor unions. In 1985 they left Nestle to form their own PR firm, Pagan International, offering their expertise and strategic advice to defense contractors as well as the chemicals, pharmaceuticals and foods industries. Pagan's clients quickly grew to include Union Carbide, Shell Oil, Occidental Corp., Chevron and the Government of Puerto Rico.¹

In 1987, the firm suffered an embarrassing setback when some one leaked to the press its "Neptune Strategy" for helping Shell Oil counter a boycott against its business dealings in South Africa. Activists were pressuring Shell and other companies to pull out of South Africa as part of a campaign against the country's racist apartheid system. Instead of divesting its South African holdings, the Neptune Strategy advised Shell to develop a task force of South Africa's church leaders, US activists and executives to issue a statement about the company's role in helping South Africa prepare for life after apartheid and to develop post-apartheid plans that will ensure the continuation and growth of the Shell companies in the United States and South Africa.²

To implement this plan, Pagan International organized and subsidized a front group composed of black clergy called the Coalition on Southern Africa (COSA). Launched with great fanfare in September 1987, COSA took of ambitious plans to develop black-black business links between South Africa and the United States, promote education and training of South African blacks, and pressure for an end to apartheid. In reality, COSA was a paper front group with no resources to carry out these goals. According to Donna Katzen, a leader in the Shell boycott, COSA reflected a deliberate attempt to divide and weaken the position of the religious community with regard to South Africa. She noted that immediately after COSA was created, companies with South African operations began to point to COSA to show that not all US church groups backed disinvestment.³

Public disclosure of the Neptune Strategy prompted Shell to cancel its account with Pagan International and company revenues plunged. Dick Morgan even left to form his own firm in partnership with other key Pagan executives including Ronald Duchen and Alvin Biscoc. Lewis is to leave I will Morgan, Biscoc and Duchen complaining that Pagan owed them money and Pagan accusing them of deliberately undermining the firm by leaking the Neptune Strategy to the press. Pagan went down in bankruptcy but the new firm of Morgan, Biscoc & Duchen (MBD) has prospered.

MBD Unplugged

Like Pagan International, MBD specializes in providing public policy intelligence. Its services do not come cheap. Regrettably clients pay a retainer ranging from \$3,500 to \$9,000 per month to Mongoven. Biscoe & Duclut sometimes produces special reports such as a 1989 analysis of the Natural Resources Defense Council, one of the country's leading mainstream environmental organizations. Corporations interested in obtaining the report paid \$1,500 per copy.

The company refuses to name its clients, but an internal MBD document says they are almost all members of the Fortune 100 and six are members of the Fortune top 20. Known clients include Monsanto, DuPont, Philip Morris and Shell Oil. Mike Miles, the former CEO of Philip Morris had a particular affinity for MBD's cold-war style. According to PR executive Robert Dilenschneider, Miles "has a voracious appetite for intelligence and he's very much aware of the other side's intelligence gathering efforts. He's so careful that he has his company's travel people glue stickers on airline ticket stubs, cautioning his executives not to talk shop while en route."

MBD tries to get on the mailing list of as many organizations as possible. Its employees read activist newsletters and other publications to keep tabs on controversial issues that may affect its clients. These interests have expanded vastly beyond the food safety issues that concerned Pagan and Mongoven during the Nestle boycott. According to MBD documents, they include acid rain, clean air, clean water, hazardous and toxic wastes, nuclear energy, recycling, South Africa, the United Nations, developments in Eastern Europe, biotech, organic farming, pesticides, biotechnology, vegetarianism, consumer groups, product safety, endangered species, oil spills. Information related to all of these topics is sifted and reviewed by company analysts, then distilled into reports and memos.¹

MBD's promotional brochure says the purpose of this research is to maintain extensive files on organizations and their leadership, particularly environmental and consumer groups, churches and other organizations which seek changes in public policy. A typical dossier on an organization includes its historical background, biographical information on key personnel, funding sources, relationships with other organizations, publications, and a characterization of the organization aimed at assessing the potential for coopting or marginalizing the organization's impact on public policy debates.

To gather information, MBD also uses covert operatives like Bill Vesterman and Kim Ziegler. Kim spies both in person and over

the phone falsely representing herself as "a writer for *Z Magazine*" or a friend of a friend. Sometimes she will correctly identify herself as representing MBD, a public affairs company—without elaborating on the real reasons behind her call.

In one single day Kara placed calls to an aide to U.S. Senator Russ Feingold (D-Wisconsin), Dr. Michael Hansen of Consumers Union—the publisher of *Consumer Reports* magazine—and Wisconsin dairy farmer Francis Goodman. She was calling as part of a frenetic MBD campaign to gather "intelligence" about groups opposed to the use of recombinant bovine growth hormone (rBGH), a controversial new genetically engineered drug being injected into dairy cows.

The Mutations Industry

Monsanto, the developer of rBGH, is one of the world's largest transnational corporations manufacturing a wide range of chemicals, drugs and other high tech products—many of which are dangerous or lethal. Monsanto was the manufacturer of most of the world's PCBs—persistent chemicals used in electrical equipment which have been shown to cause cancer and birth defects. It is also the world's largest producer of herbicides, including products contaminated with dioxin. In the area of consumer products Monsanto produces the Ortho line of lawn chemicals, as well as Nutrasweet™, a sugar substitute whose safety has been challenged by safe food activists.

Bovine growth hormone is the flagship product in Monsanto's attempt to claim leadership in the fledgling biotechnology industry. Designed to replicate a hormone that occurs naturally in cows, rBGH can increase milk production by up to 25 percent when injected into dairy cows. Monsanto spent hundreds of millions of dollars developing rBGH for commercial use, and has hyped the synthetic hormone as a miracle technology that will increase milk production and lower food costs to consumers.

In 1985, Monsanto Chief Executive Richard T. Mihalek estimated the potential market for rBGH at \$1 billion a year once the hormone received approval from the Food and Drug Administration. The stakes for the biotechnology industry as a whole were even higher. Other chemical and drug giants such as Eli Lilly, American Cyanamid, W.R. Grace, Upjohn, and Ciba-Geigy, also had major investments in biotech development and were poised to follow Monsanto's lead by introducing their own genetically altered fruits, vegetables and farm animals—frankenfoods—such as genetically engineered cows

from Biostat Myers Squibb that produce human mothers' milk protein; potatoes that kill pests by producing their own insecticide; slow-opening tomatoe virus-resistant squash; herbicide-tolerant cotton and soybean plants; growth hormone for pigs; and meat from cloned cattle.

Beginning in 1980, however, rBGH faced organized international resistance spearheaded by Jeremy Rifkin's Foundation on Economic Trends. The issue attracted other rBGH opponents including the Consumers Union, the Humane Society of the U.S., Food and Water Inc., and grassroots farmer organizations. Critics of the hormone raised a number of serious questions about its safety and alleged benefits:

- Monsanto's own tests showed increased levels of mastitis, a painful udder infection, in cows injected with rBGH. According to food safety experts, increased mastitis would force farmers to use more antibiotics which would then be more likely to contaminate the cows' milk. Milk from treated cows would also spoil faster because it contains more bacteria and has a higher somatic cell count. Translated from scientific jargon into layman's language, this means that rBGH induced milk contains more pus.¹
- Dr. Richard Burroughs worked for the FDA from 1985 to 1988 analyzing test data supplied by Monsanto and the other companies engaged in developing rBGH. His analysis convinced him that the companies were manipulating data. In 1986, Burroughs was fired after he went to Congress accusing his superiors of covering up this information.²
- Cows treated with rBGH need to consume more protein, often in the form of rendered animal protein derived from the carcasses of cows and other dead animals. Cows consuming animal by-products are susceptible to bovine spongiform encephalopathy, also known as "mad cow disease." This disease has plagued Britain for decades and some doctors worry that it could migrate from cows to humans as a fatal dementia called CJD.
- Increased milk production from rBGH hardly seemed like a blessing to dairy farmers struggling to survive in the deregulated market. And rBGH came with extra costs. Small dairy farmers fearing high production costs and low market prices worried that the larger ones threatened their livelihood. Already threatened by competition from large dairy corporations.

In response to this opposition, Monsanto and its corporate allies pulled out all the stops. They hired whores who散布 heavy hitting

ER firms and lobbyists, including Hill & Knowlton, Burson-Masteller, Leibman, Terry, Dryer & Associates, Manning, Selvage & Lee, Morgan & Myers, Porter Novelli, Covington & Burling, King & Spalding, and Potomac & Heidepriem. The PRC organized presentations to dairy farmers and veterinarians, lobbying of state legislators, and the distribution of thousands of brochures, videotapes and other pro-BST materials to the press and the general public. The Animal Health Institute, based in Alexandria, Virginia, coordinated the PR campaign. During the three years from 1988 to 1991 alone, the Animal Health Institute spent over \$900,000 on BST promotion.

Activists might compare one PRC's methodology for doing opposition research in November 1990. The Consumers Union, editor of *Consumer Reports* magazine, was preparing a highly critical report on BST when a woman claiming to be a scheduler for ABC-TV's *Nightline* contacted Michael Hansen, the report's author and requested a preview of his findings. The woman said *Nightline* was interested in Hansen's research for a show they were considering on the BST controversy and asked Hansen to fax her his curriculum vita. Somewhat suspicious, Hansen phoned a friend at ABC to follow up on the *Nightline* call. His friend, David Sostman who worked in the tape library at ABC News, discovered that no one on the *Nightline* staff had contacted Hansen. Intrigued, Sostman tracked the mystery caller. The bottom line was they said they were calling from ABC but the fax number they gave came from PRC/Burson-Masteller's office in D.C.

As part of its public relations campaign, the pro-BST coalition used polling and focus groups to determine public attitudes toward dairy foods from hormone-treated cows. The results were disconcerting. Surveys showed widespread concern about the industry's claim that BST milk would be no different from untreated cows. A large majority (nearly half) of parents with children under 18 reported that they did not eat cheese or yogurt would be discovered in the future.

In late 1989 media coverage of the Hormandol and petrochemical pollution of milk began to decline. The pro-BST Day Corporation responded by setting up a 24-hour telephone hotlines and developed over 200 regional experts, including growers, nutritionists and animal scientists to act as media contacts. The corporation prepared educational resource kits for distribution to over 1,000 targeted recipients, including 4-H clubs, state and national track issue others, federal and state congressional members and members of the

National Association of Science Writers. The PR campaign lined up supporters from the American Academy of Pediatrics and the National Institutes of Health. It arranged for the American Medical Association to publish an article and an editorial (written by scientists who had received research grants from Monsanto) claiming that all available scientific evidence showed rBGH was safe.

The National Dairy Promotion and Research Board, a quasi-governmental agency, also brought into the campaign. In theory, the National Dairy Board is supposed to promote the interests of dairy farmers. Its \$75 million annual budget comes from farmers in the form of mandatory deductions from milk sales. Publicly, the Dairy Board declared its "neutrality" on the rBGH issue. However, internal documents obtained through the Freedom of Information Act revealed that the Board was working in cahoots with Monsanto.

Secret Agents

In November 1991, a farm advocacy group called Rural Vermont issued a report based on information obtained from a dairy scientist at the University of Vermont—one of the state universities around the country engaged in testing rBGH research sponsored by Monsanto. Contrary to Monsanto's claims of rBGH safety, the scientist's data showed an unusually high rate of deformed calves born to rBGH-treated cows. University officials reacted with outrage. University PR spokesperson Nicola Marro insisted in an interview that the Rural Vermont report was merely the first wave of a national, well-coordinated campaign against rBGH organized by Jeremy Rifkin. How did Marro know that this campaign was being planned? "Monsanto had a mole in Rifkin's meeting," Marro said.²⁹

A little research quickly confirmed the truth of Marro's boast. In October 1990, Rifkin's organization had participated in a conference in Washington, DC, to oppose rBGH. One of the participants at the meeting was a woman who identified herself as Diane Moser, an intern working for the Maryland Citizens Consumer Council. As conference participants racked their brains to guess who might have been the "mole," several people immediately thought of her. Moser had brought a book to the meeting and avoided small talk. She said she represented housewives concerned about BtH—recalled Andrew Christianson, a Vermont state representative who had been at the DC meeting. "I had suspicions immediately. I've never seen anyone with a paperback coming to a meeting like that. It's usually pretty serious activists."³⁰

An investigation quickly showed that the Maryland Citizens Consumer Council did not exist, and searching by activists revealed that Moser was an employee of Bausen Marsteller. A reporter called Dorothy Brostidum, general manager for BMS's Washington office: "I know Diane, but I have no idea what she does in her spare time." Brostidum said. Further investigation linked another member of the nonexistent Maryland Citizens Consumer Council to Bausen Marsteller: Joann Loss (aka Lisa Davis), who like Diane Moser worked under the supervision of BMS vice-president Sheila Riva. In response to reporters' questions, Riva—who has since been promoted to CEO of BMS's Washington office—believed like a model spymaster, disavowing any knowledge of the operation.¹⁰

Kaufman PR, the National Dairy Board's PR agency from 1990-91, spied on another anti-BSEH meeting, this time in New York City in January of 1990. After the event, organizers discovered that Monsanto PR coordinator Larry O'Neil had successfully contacted New York media in advance of the conference to convince them it would not be newsworthy. A check of National Dairy Board records through the Freedom of Information Act showed that several of the conference attendees were PR spies. Four days before the meeting, Kaufman PR had signed a subcontract agreement with the Direct Impact Co., in Alexandria, Virginia, a PR firm that specializes in grassroots lobbying. The agreement called for Direct Impact to recruit between six and eight residents of New York to attend the event, monitor developments, ask questions, and provide other support as appropriate. Each attendee must be able to articulate the basic (pro-BSEH) arguments on the issue and cite one of three substantive reasons for supporting the Dairy Board's position.

The purpose of the covert operation was apparently to generate news coverage of the conference and to spin the coverage by planting "housewives" in the audience who would appear to favor injecting milk cows with bovine growth hormone.

The Kaufman-Direct Impact covert action was less than subtle. When a woman said she was a teacher, housewife and then made highly technical statements you knew she had taken clippings her information from *Better Homes and Gardens*. It was kind of a Big Grade spy routine," said conference organizer Dave Carter.¹¹

Going to the Dogs

The ubiquitous Sergeant Rolf Astromire spied on pro-BSEH groups and also infiltrated a number of consumer rights organizations

in the late 1980s. His name appeared as senior contributing editor on a newsletter titled the *Animal Rights Reporter* published by Perceptions Press. The *Animal Rights Reporter* claimed to be an 'objective analysis of the animal rights movement.' In reality it offered persistently negative reporting on animal rights groups and advice on undermining the movement. Animal rights activists who saw the newsletter were shocked to find that it contained details about their organizations that could only have been known by their own members.⁴⁹

Fund for Animals staffer Heidi Prescott recalls someone pointing Vestermark out to her and warning that he was a spy when she first began attending rallies in 1989. It was kind of common knowledge among people who went to a lot of the animal rights events, she said.

He was laid back and came across real friendly. He'd show up and look around and talk to people. I saw a someone would recognize him and go over and say, 'He works for Perceptions Press.'

Perceptions Press was the publishing arm of a two-company operation owned by Jan Reber, an unlicensed private investigator whose other business, Perceptions International, provided information gathering and security services to transnational corporations, including research on coercive trends and movements that affect business—in particular animal rights activists and environmentalists.⁵⁰ Its clients included Leon Hirsch, the controversial president of the US Surgical Company in Norwalk, Connecticut. US Surgical manufactures surgical staples used in place of conventional sutures to close wounds and surgical incisions. Financially, the company was a smashing success, with \$91.2 million in profits in 1991, of which \$23.3 million in salary and stock options went to Hirsch himself.⁵¹

Hirsch called himself an 'only in America' success story, but animal rights activists were upset with the methods the company used to market its product. To demonstrate the advantages of staples over sutures, US Surgical contacts training demonstrations for surgeons in which they cut open live dogs and staple their intestines. After the demonstration, the dogs are killed. By US Surgical's own estimate, it disposes of over 1,300 dogs a year.

In 1981 a local newspaper wrote an article about the company's use of dogs, prompting a series of protests outside US Surgical Headquarters by a Norwalk animal rights group, Friends of Animals (FOA). Following one demonstration, FOA vice-president Sarah Seymour discovered that she was being followed by Bud Vestermark and Jan Reber. They trailed her by car to her child's school and took photo-

Activists turned the tables on Seymour "Bud" Vestermark, Jr., by taking this picture of him as he spied on an animal rights rally. (photo courtesy of Friends of Animals)

graphs of her. Sarah Seymour went over to confront them, and Robert denied that he was following her—*I'm just here to pick up my own kid*, he said. Seymour checked and learned that none of Robert's children were enrolled at the school. The incident upset her. It seemed like an attempt at intimidation. But it was nothing compared to later events.

Bombing the Bosses

According to journalist Lisa McGurnan Driscoll, May Ida Sapone entered the animal rights movement in the summer of 1987 when she appeared at a conference in Washington, DC. She first burst on the scene, said Julie Lewin, FOAS Connecticut coordinator. A friendly, talkative woman, Sapone immediately became involved in at least a half dozen animal rights groups. She seemed to be everywhere, traveling all around the country to participate in protests, meetings and conferences.

Animal rights activists began to have suspicions about Sapone. Unlike most activists, she seemed to have unlimited time and money

She seemed unusually inquisitive, making a point of getting to know all of the key people in the movement. She always asked questions and carried a pad of paper taking notes," said Kim Bartell, editor of a magazine called *Animals Agenda* who first met Sipone in June 1987 at a demonstration in Massachusetts. Bartell noticed that Sipone's statements "didn't add up." First she said she was a psychotherapist, then a Lamaze instructor and then a social worker. Betsy Swift, chairwoman of a San Francisco-based animal rights group became so suspicious of Sipone's questions that I made up a date and told her there would be a demonstration. Within days, Swift said she received a call from a government official asking about the "demonstration."⁴⁴

Sipone frequently urged others to commit violent or illegal disruptions. She showed a lack of judgment, always looking for action. This woman clearly seemed to be reckless with no appreciation for the political and moral ramifications of violence, Lewin said.⁴⁵

In April 1988 Sipone and Lewin attended a demonstration in New York City where Sipone introduced Lewin to a woman named Fran Steptane Trutt, a 43-year-old part-time math teacher who Sipone described as "someone who looks as in New York." Lewin was not impressed with Trutt, who seemed unshaved and not too tightly wrapped. She wore lumpy clothing and her hair was askew. After talking to her briefly, Lewin decided that Trutt was "pretty crazy and excused herself."

FOA president Priscilla Feral had met Trutt two years earlier at a US Surgical demonstration and formed a similar opinion. My assistant saw her stomping on aztecs. She seemed particularly angry, Feral recalled.⁴⁶

Unlike the other animal rights activists, Mary Lou Sipone took an active interest in Trutt, befriending her and cultivating a close relationship. Over the course of the next six months, Sipone and Trutt spoke by phone at least two or three times a week. Unbeknownst to Trutt, Sipone—a spy for Perceptions International—was secretly tape recording the conversations and giving the tapes to US Surgical along with written reports detailing her efforts to locate Trutt in carrying out a murder attempt against US Surgeon general Leon Hirschen. In 1988 US Surgical paid Perceptions International over \$10,000, of which \$6,000 went to pay Sipone.⁴⁷ Normally, of course, company presidents do not pay to arrange their own murder, but Hirschen was neither crazy nor stupid. He was trying to engineer an embarrassing scandal that would discredit the animal

rights movement—and if the resulting sensational court case had not unearthed tape transcripts and other confidential company documents—he probably would have succeeded.

Iran Trutt was a vulnerable lonely angry woman. She talked wildly of killing her ex-lover. The transcripts of Sapone's phone conversations with Trutt show Sapone's efforts to direct that anger toward Leon Hirsch. On May 23, for example, the two women reviewed possible murder scenarios. Trutt commented that the police would probably identify her as a suspect if she killed her ex-lover:

Sapone replied, "Well, maybe you could so maybe you should do Leon first."

Trutt laughed, and Sapone added, "I mean if you think that this with this other guy that they should come to you—

"Well, the other one—they're going to come to me first. There's no question about that," Trutt said.

"So maybe you should do Leon first," Sapone repeated.

When Trutt showed signs of losing her resolve, Petrecca orchestrated a supposedly accidental meeting in September 1988 between Trutt and another agent, Marcus Mead. The meeting took place in a pizza shop, where Mead struck up a conversation with Trutt by asking her for advice on taking care of his puppies. Mead, whose sister was employed by U.S. Surgical, was paid \$50 a week to befriend Trutt and to help egg her on. To help him impress her, U.S. Surgical loaned him the use of a Porsche and an Alfa-Romeo.⁹

Sapone and Mead gave Trutt money to buy bombs. In a tape-recorded conversation on November 11, Trutt thanked Sapone for giving her \$100 which Trutt used for rent. Sapone replied, "if you want to use it for the bomb test or the rent first, I mean, I didn't care because you know you knew what you had to do." The following day, Mead drove Trutt and two pipe bombs from New York to U.S. Surgical headquarters in Connecticut, where she was arrested under a plea arrangement deal with the Norwalk Police Department. Animal rights activists later wondered why the police had allowed Mead to drive an explosive device across interstate highways rather than stop & arrest her earlier when the bombs had been stored. The arrest seemed aimed for maximum publicity value, with public safety a secondary concern.

News of the arrest spread quickly through the animal rights movement. Shocked and stunned, local towns phoned Sapone trying to figure out who Trutt was. In the ensuing conversation, which was

also secretly recorded Sapone withheld information about her relationship with Trout and pretended to search her memory.

"I think the name is familiar," Sapone said. "I'm trying to piece this together.... I remember the last name because it was kind of distinctive. It was like a strong— you know—I remember I remember names sometimes . . ."

A local reporter had informed Lewin that a tip had thwarted the bombing, prompting Lewin to speculate that the bombing might have been "*agent provocateur* kind of stuff like in the 60s."

"What would that game?" Sapone asked with false naivete.

"It gains a blackening of our movement."

"Oh, I see."

No one that I work with in the state would ever consider such an act," Lewin said. "We'd be the first to turn them in."

"Gosh," said Sapone the *prosecutor*, "this is like a nightmare." For US Surgical, of course, the nightmare was a long-cherished dream. The *Animal Rights Reporter* lost no time in denouncing Trout's action as a comparable to "the shooting down of a civilian Korean airline by a local terrorist group" and "murderous attacks like the Achille Lauro incident."⁵⁵

Even after Sapone's role in befriending and encouraging Trout was disclosed, US Surgical continued to claim that the incident was an example of terrorist tendencies in the animal rights movement. "People think of animal rights as protecting the birds in the winter and the little puppies," said US Surgical Attorney Hugh F. Keefe. "I don't think they realize the militancy that has invaded some of these groups." Keefe used pretrial proceedings to seek exhaustive information about Friends of Animals, including lists of all contributors, Lewin's personal diary and personal income tax returns, and all of her medical and psychiatric records—a request she interpreted as an effort to dig up dirt on the animal rights movement.

The people who are challenging this corporation are very smart," said New Haven attorney John Williams, who represented both Trout and Lewin. "US Surgical is going berserk and spending enormous amounts of money. It's become a personal vendetta for Leon Hirsch. The kinds of abuses that we associate with the FBI under J. Edgar Hoover are now in the realm of private corporations subsidizing a private security force."⁵⁶

CHAPTER SIX

Divide and Conquer

We see then that there are many ways to one's object in War, that the complete suppression of the enemy is not essential in every case.

CARL VON CLAUSEWITZ
On War

In 1980, a drunk driver killed the 13-year-old daughter of Candy Lightner. Devastated and angry, Lightner created an organization called Mothers Against Drunk Driving (MADD) to publicize the suffering caused by drug and alcohol abuse. Hollywood publicist Michael Levine described Lightner as a natural practitioner of what he calls "guerrilla PR." In his book by that title, Levine praised this dynamic woman who used the sheer strength of her character to forge a movement. After Lightner and her surviving daughter held a press conference to describe the consequences of drunk driving, Levine said, "a photo of the tearful mother and daughter flashed around the world, and suddenly the agony of death from driving under the influence had a face and a name: Candy Lightner."

"We hadn't planned scenes of crying," Lightner said. "But instead they we knew the media need something dramatic. After seeing the reaction to the photo, she wanted to use it as an opportunity to dramatize her cause. In a campaign to pass a California bill requiring a five-cent tax on alcohol, she sent her daughter to buy a backpack with a fake I.D. She then held a press conference—with her daughter sitting behind a small mountain of beers she'd just bought—demonstrating how enormous the problem actually was.

MADD quickly grew to three million members in the U.S. alone, but Lightner's talents have been diverted to other purposes. In 1988 she left the organization over disagreements that included her desire

to have MADD receive financial contributions from the liquor industry. She moved to Washington DC where she was hired by the American Beverage Institute, a liquor industry trade group to help defeat MADD-supported laws that would toughen blood alcohol tests.²

Dealing With Idealists

Since at least the days of Aristotle, practitioners of the art of rhetoric have understood that an endorsement from their opponent carries more persuasive power than anything they can say themselves. The public relations industry therefore carefully cultivates activists who can be coopted into working against the goals of their movement. This strategy has been outlined in detail by Ronald Duchen, senior vice president of PR spy firm Mongoven, Biscione and Duchen. A graduate of the US Army War College, Duchen worked as a special assistant to the Secretary of Defense and director of public affairs for the Veterans of Foreign Wars before joining Pagan International and MBD. In a 1991 speech to the National Cattlemen's Association, he described how MBD works to divide and conquer activist movements. Activists, he explained, fall into four distinct categories: radicals, opportunists, idealists, and realists. He outlined a three-step strategy: (1) isolate the radicals; (2) cultivate the idealists and "educate" them into becoming realists; then (3) coopt the realists into agreeing with industry.

According to Duchen, radical activists want to change the system, have underlying socio-political motives, and see multinational corporations as inherently evil. These organizations do not trust the federal, state and local governments to protect them and to safeguard the environment. They believe rather that individuals and local groups should have direct power over industry. I would categorize their principal aims right now as social justice and political empowerment.

Idealists are also hard to deal with. They want a perfect world and find it easy to bring any product or practice which can be shown to mar that perfection as evil. Because of the intrinsic altruism, however, and because they have nothing perceptible to be gained by holding their position, they are easily believed by both the media and the public, and sometimes even politicians. However, idealists have a vulnerable point. If they can be shown that their position in opposition to an industry or its products causes harm to others and cannot be ethically justified, they are forced to change their posi-

bon. Thus while a realist must be negotiated with, an idealist must be educated. Generally this education process requires great sensitivity and understanding on the part of the educator.

By contrast, opportunists and realists are easier to manipulate. Duclan defines opportunists as people who engage in activism seeking visibility, power, followers and, perhaps, even employment. The key to dealing with opportunists is to provide them with at least the perception of a partial victory. And realists are able to live with trade-offs, willing to work within the system, not interested in radical change, pragmatic. The realists should always receive the highest priority in any strategy dealing with a public policy issue. If your industry can successfully bring about these relationships, the credibility of the radicals will be lost and opportunists can be counted on to share in the final policy solution.

Flacks to Greens: "Grow Up and Take the Cash"

The February 1991 issue of *ODIverser's PR Services Report* gives a candid description of the PR industry's strategy for encouraging sectors of the environmental movement to enter into partnerships with major polluters. The lessons of the recent recession have taught PR people that no matter how idealistic a company sounds, it puts the bottom line ahead of cleaning up its mess, admits an editorial accompanying the report. As a cost-effective alternative, such companies are finding that cash will buy them good will from the environmental movement. Cash-rich companies' PR people say are funding hard-up environmental groups in the belief that the immature activists will go a long way in improving their reputation among environmentally aware consumers.

On the other side of the partnership, *ODIver*s observes, non-profit groups are beginning to realize that private sector cash can increase an organization's clout and bankroll membership building programs. *ODIver*s sees this increased willingness to take private sector cash as evidence of maturing in the environmental movement.¹

ODIver interviewed Dick Dickey of H&K in Washington, DC, the nation's third largest environmental PR firm. Dickey said companies are learning that they can benefit from the environmental group's staff to tackle certain projects. This is often a dual benefit for a company that wants to have access to top environmental experts. Companies can put themselves off-limits to consultants and analysts at very reasonable prices.

Getting a relationship started between a company and an environmental group carries some risks as well. It might be in both parties' interest at first to keep their relationship out of the news, says Didion. Work out early how and when the relationship will be announced to the media—and what measure should be taken if word leaks out prematurely, he advises.

O'Dwyer suggested some "cost-free and virtually risk-free" ways to test the waters when entering into a relationship with an environmental group. Help them raise money. Offer to sit on their board of directors. That can open up a good symbiotic relationship. Another effective tool is for the company to bankroll a conference on a topic of mutual interest, or fund an issue-specific publication for the nonprofit group. The company gets substantial input into the content because the publication has its name on it, Didion said.

Strange Bedfellows

To help industry determine how and which activists can be coopted, the Public Affairs Council, a trade association for public relations executives, sponsors a tax-exempt organization called the Foundation for Public Affairs. Funding comes from a who's who of America's corporate establishment, including AmgenTech, Ashland Oil, Boeing, Dow Chemical, Exxon, Health Insurance Association of America, Philip Morris, Mobil, Pharmaceutical Manufacturers Association, RJR Nabisco, and Shell Oil. Many PR lobby firms also are members, including Bonner & Associates, Burson-Marsteller, E. Bruce Harrison, The Jefferson Group, and Mongoven, Biscoe & Ducomm.

The Foundation for Public Affairs monitors more than 75 specialized activist publications and gathers information on more than 1,400 activist organizations, research institutions, and other groups. Until 1993, the Foundation published an impressive biannual directory titled *Public Interest Profile*, which offered intelligence on 250 of the nation's key public interest groups, including current concerns, budget, funding sources, board of directors, publications, conferences, and methods of operation. In the 1992-93 version of this phonebook-sized tract, groups were profiled in chapters headed Community, Grassroots, Corporate Accountability, Responsibility, Environment, Think Tanks, etc.

Once a year, the Foundation for Public Affairs organizes a two-day Annual Conference on Activist Groups and Public Policymaking where professional activists and staff members of prominent DC-based consumer and environmental organizations are invited to rub

shoulders with influential corporate PR executives. The conference helps corporate flacks learn how to dissect the strategies, tactics and agendas of these activists, to better defeat or coopt their activism. The meeting is billed as a strictly off-the-record affair – a once-in-a-kind opportunity to explore the agendas, strategies and influence of leading public interest groups.¹⁵

According to a promotional brochure, the purpose of the 1993 conference was to help PR executives find out the answers to questions such as: "What tactics are being employed by activists to achieve their goals? What methods can be used by business in cultivating ties with activist groups and what are the potential benefits – and/or drawbacks?" Corporate attendance cost \$515. Featured speakers included NRI's Ronald Dochin, along with Gene Karpinsky, head of the US Public Interest Research Group, and Gustav E. Jackson of the Citizens Clearinghouse for Hazardous Wastes. Stephen Brobeck, executive director of the Consumer Federation of America, also spoke for an hour "on what the dominant consumer issues and trends will be throughout the decade and what it all portends for corporate America." Conference attendees also heard from right-wing speakers including Patrick Noonan, the President of the Conservation Fund who sits on the Board of Ashland Oil; Ralph Reed, Executive Director of the Christian Coalition; and Fred Smith of the Competitive Enterprise Institute.¹⁶

The Best Friends Money Can Buy

The American Civil Liberties Union is one of the organizations that has been successfully recruited by the tobacco industry to promote the myth that smoking is a "civil right" comparable to freedom of speech and association. The ACLU denies charges by the Tobacco Institute that it is beholden to tobacco interests, but it cannot deny its own financial records which show that the ACLU solicited and accepted about \$500,000 in contributions from tobacco interests between 1987 and 1992 without disclosing the linkage to its ACLU membership.¹⁷

In Monsanto's campaign for approval of bovine growth hormone it was able to buy the support of Carol Tucker Foreman, formerly executive director of the Consumer Federation of America. Foreman took a job in early 1993 as a personal lobbyist for Monsanto's PR team, for what is rumored to be an extremely large fee. With her help, Monsanto has successfully prevented Congress or the FDA from requiring labeling of milk from rBGH-injected cows, and in fact the

company has used threats of lawsuits to intimidate dairy retailers who want to label their milk "rBGH free."

Foreman, a former Assistant Secretary of Agriculture, is also the coordinator and lobbyist for the Safe Food Coalition, which calls itself "an alliance of consumer advocacy, senior citizen, whistleblower protection and labor organizations." Formed in 1987 by Foreman, its members include such public interest heavyweights as Michael Jacobsen's Center for Science in the Public Interest (CSPI), Ralph Nader's Public Citizen, and Public Voice for Food and Health Policy.¹⁸

When interviewed, Foreman said she saw no conflict of interest between lobbying for rBGH and for the Safe Food Coalition. The FDA has said rBGH is safe, she explained, adding "Why don't you call CSPI, they say rBGH is safe too?" When asked how much money she has received from Monsanto to lobby for rBGH, she angrily declined to answer, saying "What in the world business is that of yours?" Her DC consulting firm, Foreman & Heideprecht, refused to provide further information and referred journalists to Monsanto's PR department.¹⁹

Playing Both Sides

In the November 22, 1993 *Legal Times* writer Sheila Kaplan describes the work of Porter Novelli, a New York based PR firm that specializes in what founder William Novelli refers to as "cross pollination." By providing free work for health-related charities, Porter Novelli is often able to persuade them to support the interests of its paying corporate clients. In spring of 1993, for example, produce growers and pesticide manufacturers represented by Porter Novelli were alarmed to learn that the Public Broadcasting Service was about to air a documentary by Bill Moyers on the cancer risks that pesticides pose to children. To rebut the documentary, they turned to the government's National Cancer Institute (NCI) and the American Cancer Society (ACS). Porter Novelli works for NCI and has provided free services to the ACS for over 20 years. It persuaded the national office of ACS to issue a memo downplaying the risk of cancer from pesticides. The program makes unfounded suggestions . . . that pesticide residues in food may be at hazardous levels," said the memo, which the pesticide industry cited as "evidence" that the Moyers documentary overstated dangers to children from pesticides.

"I have a longstanding concern that contractors work both sides of the street and that government agencies are unaware of these conflicting relationships," said Senator David Pryor (D-Ark.), the

chairman of the subcommittee that oversees federal contracts. This remains a glaring deficiency.

Hill & Knowlton executive Nina Oligino used a similar "cross-pollination" strategy in 1991 to line up national environmental groups behind a coalition called "Partners for Sun Protection Awareness," a front group for Hill & Knowlton's client, drug transnational Schering Plough. Best known for Coppertone® sun lotion, Schering Plough uses the coalition to educate the public about the dangers of skin cancer deaths, cataracts and damaged immune systems due to the atmosphere's thinning ozone layer and increased ultraviolet radiation. The campaign urges people to liberally apply a sunscreen to all exposed parts of the body before going outdoors.

Hill & Knowlton successfully enlisted leaders of the Natural Resources Defense Council and the Sierra Club to add their names to the "Partners for Sun Protection" letterhead. Apparently these groups are little more than a dash of green window dressing for the campaign. The Partners offered no proposals for preventing further thinning of the ozone layer. A representative of one of the environmental groups who asked not to be named said he was ignorant of the Schering Plough funding and its hidden agenda to sell sun lotion.

The best prevention for sun-caused skin cancer is, of course, to cover up completely—but saying so would be market suicide for the world's largest maker of suntan lotion and purveyor of the sex "Coppertone" tan. One of the campaign's clever video news releases shows scores of sexy, scantily-clad sun worshippers still over-exposing themselves to UV rays while slathering themselves with suntan oil. The VNR does not mention Schering Plough, the funder of the PR campaign.¹⁴ Ironically, Hill & Knowlton has also worked for corporate clients who hired them to belittle the environmental risks of global climate change.¹⁵

Going the Extra Mile

Some companies such as Ben & Jerry's ice cream and the Body Shop cosmetics use progressive position rhetoric and claims of social responsibility as the centerpiece of their marketing campaigns. The Body Shop and Ben & Jerry's are among the founders of an association calling itself Business for Social Responsibility, launched in 1992 by 54 companies with progressive reputations including the Stride Rite Corporation and Levi Strauss. By 1995 it had grown to over 200 companies, including many whose social responsibility is dubious at best. In order to increase its funding and corporate

cont. BSR has actively recruited major corporations as members including FedEx, Home Depot, Viacom, The Gap, AT&T, the Clorox Company, Kidder Peabody & Co., Reebok, Starbucks Coffee Co., Polaroid Corporation, Honeywell, Time Warner, Taco Bell—and Monsanto.²⁵

According to Craig Cox, former editor of *Business Ethics* magazine, Monsanto claims to have cut its toxic air emissions substantially and is attempting to adopt other socially responsible business practices advocated by BSR. However, these improvements in Monsanto's production process don't change the fact that the company's most profitable products include dangerous pesticides, artificial food additives, and risky bioengineered products. Monsanto's membership in BSR underscores a fundamental dilemma: How does the movement for socially responsible business define social responsibility? If Monsanto belongs in the club, why not socially responsible nuclear arms dealers? Can the tobacco industry join?

This dilemma forced the BSR board of directors to decline its policy on eligibility for membership. After discussion, the board decided it would be counter productive to impose specific standards of social responsibility on members. According to BSR President Bob Dunn, the board adopted an "all-inclusive membership policy so long as companies demonstrate that they understand our mission, understand the principles of the organization and they wish to be a member because of their own interest in improving their policies and practices."

The bottom line is that BSR's membership now includes some of the most environmentally destructive corporations on the planet, and more are safe to join. Some of the companies that have joined BSR are also financially supporting corporate front groups and business associations lobbying to weaken important environmental, consumer protection and civil rights laws, and funding right-wing advocacy groups set up to spread the message that environmental protection is incompatible with a healthy economy.

BSR's value as a vehicle for social change is further limited by the organization's decision not to take positions on specific legislation. This political neutrality stands in noticeable contrast to the right-wing activism of other corporate-sponsored associations such as the US Chamber of Commerce and the Business Roundtable, which are leading the charge to undermine even the mildest efforts to challenge the political power of big corporations.

BSR compensates for its limited commitment to social change with a seemingly unlimited devotion to right-wing rhetoric. For the last 10

years it's been a very Pollyannish type of movement." Cox admits.⁷⁸ Speaking to a 1994 meeting of the Public Relations Society of America, BSR founder Michael Leveit said the organization's goal is to "benefit our companies, employees, environment and communities and demonstrate the growing link between corporate responsibility and corporate prosperity." A similar upbeat spirit pervaded BSR's 1994 annual conference in Cambridge, Massachusetts. Titled *Beyond the Bottom Line: Putting Social Responsibility to Work for your Business and the World*, the conference featured cheerleading about the power of the private sector to build markets and demand for socially responsible business and broad public support for environmental and energy related efforts. It featured an appearance via satellite of First Lady Hillary Rodham Clinton. PR workshops included "Communicating Your Socially Responsible Message with Integrity" and "Negative Press: Best Practices, Worst Nightmares."

Many PR firms have joined BSR including Cone, Coughlin Communications, DDB Needham, the Delphive Group, the Ketchum Group, and Ketchum Communications.⁷⁹ BSR's goals, stated in its literature, include "connecting member companies with the press and developing a higher level of visibility for our members' efforts. BSR thus enables its member companies to build an *image* of social responsibility and to persuade consumers that buying their products will contribute to building a better world. But even leaders within the BSR movement like Ben & Jerry's ice cream have found it easier to improve their *image* than it is to reconcile social responsibility with profitability.

In 1994 Ben & Jerry's did its first social audit—said Craig Cox. Paul Hawken looked at the company's operations and internal practices versus marketing. The result was fairly sobering for folks at Ben & Jerry's. Major media proclaimed that Ben & Jerry's wasn't as pure as they had marketed themselves to be or as consumers had believed them to be. Ben & Jerry's didn't purposefully green-wash, but there was a misleading public perception which they helped to create.⁸⁰

The gap between words and deeds has truly become a major scandal for the Body Shop cosmetics company which is so outspoken in its progressive rhetoric that owner Anita Roddick has been dubbed the "Mother Theresa of capitalism." In a cassette version of her autobiography titled *Body and Soul: Profit with Principles*, Roddick had written personal and anti-global hate the beauty business. It's an \$80 billion/year industry that sells sustainable dreams. It does it cheap,

it exploits women and makes them unhappy — It wastes the time energy and resources of consumers workers and of the earth itself All of that in order to sell what amounts to packaging for exorbitant prices To me the whole notion of making beauty into a business is profoundly disturbing By contrast Roddick claimed "We simply and honestly sell wholesome products that women want We sell them at reasonable prices without exploiting anyone, without hurting animals, without hurting the earth We do it without lying, cheating and without even advertising."

In place of traditional paid advertising, Roddick mastered the public relations art of obtaining "free publicity" for her company by linking herself to a variety of progressive causes Reporters flocked to cover the Body Shop's use of natural ingredients in its products opposition to animal testing and support for organizations such as Amnesty International and Greenpeace To highlight its concern for indigenous cultures in the Third World the Body Shop publicized its "Trade Not Aid" program which claimed to support indigenous groups by buying ingredients for its cosmetics from them

"It was a great two-for-one sale: buy a Body Shop lotion and get social idealism for free," said journalist Jon Entine In 1994, however, Entine began a series of investigative reports and discovered that only a minuscule fraction of the Body Shop's ingredients come from Trade Not Aid Entine also discovered that the company

- used many outdated off-the-shelf product formulas filled with non-renewable petrochemicals,
- used animal tested ingredients and
- had a history of quality control problems including selling products that were contaminated and contained formaldehyde.

To begin his research Entine said "The very first thing I did was contact the Body Shop's PR department in New York They were not used to people asking real questions they were quite shocked when I asked if there was some kind of outside auditing procedure that verified their claims they looked at me like I was a man from Mars They promised they'd send me many, many documents to verify their claims Instead within the next two or three weeks I received libel threats from their lawyers in New York and London Over the next three weeks while I was at ABC every three or four days they came up with a new set of letters They'd make these accusations but they never would attach my name to them I had never been treated that way by any subject of a story before They would react with this

incredible anger. It was all part of their orchestrated theatrics. Anyone who cared about social responsibility and took the issues of honesty and integrity seriously was threatened. Anyone who questioned the Body Shop in a serious way was subjected to threats.

To combat Entine's story which appeared in *Business Ethics* magazine, the Body Shop turned to their PR guru Frank Mankiewicz of Hill & Knowlton. A former president of National Public Radio, Mankiewicz issued his former NPR colleagues for running a piece critical of the Body Shop. NPR responded by removing the original NPR reporter and editor from the story.²

The fallout over the Body Shop also prompted Ben Cohen—the Ben of Ben & Jerry—to resign from the advisory board of *Business Ethics* magazine in protest against the publication of Entine's exposé. Ben's response was extremely disappointing and made me wonder where his heart is really at, said magazine editor Craig Cox.

A full week before our story was distributed to anyone, he sent us a letter demanding that we pull the story. In the letter he said that the story was a bundle of lies. He had never seen the story. Ben's response was a horrific overreaction that said to me that he had more allegiance to Anita Roddick than he had to this movement's state.

The thing about Ben was that when the article went to print he knew that Jon Entine was investigating Ben & Jerry's about their Trade Not Aid stuff. He knew that his company may be next on the front line. He knew that this story was going to raise fundamental questions about socially responsible business and that his company would be scrutinized more than ever before.³

In addition Cox charged that Hill & Knowlton used another firm as an intermediary to obtain the mailing list of *Business Ethics* subscribers so the Body Shop could send them a ten-page letter attacking Entine's article. Apparently a company named Hoffman and Associates used an list broker and said they wanted to rent the list to do a mailing of a non-profit catalog. Cox said, Apparently Hoffman and Associates gave the list to the Body Shop. The point that has to be made about various attempts to refute the story is that in more than 20 pages they wrote to our subscribers and on their board the Body Shop was not able to refute one statement of fact.

We are a five member staff and were trying to respond to a PR machine Hill & Knowlton that has more resources than any other PR machine in the world. Hill & Knowlton is the best known and most powerful PR firm in the US and they are letting us win everything they've got.⁴

According to Entine, the story of the Body Shop's rise and fall as an icon of social responsibility teaches an important lesson for citizens. "The Body Shop is a corporation with the same privileges and power in our society as all others. Like other corporations it makes products that are unsustainable, encourages consumption, uses non-renewable materials, hires giant PR and law firms, and exaggerates its environmental policies. If we are to become a sustainable society it is crucial that we have institutions, whether they be corporations or not, that are truly sustainable. The Body Shop has deceived the public by trying to make us think that they are a lot farther down the road to sustainability than they really are. We should recognize and encourage corporations that are moving in the right direction but no longer should the public lionize the Body Shop and others who claim to be something they are not."¹⁶

In fact, warns author Paul Hawken, overhyped claims of social responsibility "create dangerous illusions that may prevent society from recognizing the magnitude of the dangers it faces and moving in the direction of true sustainability." If every company on the planet were to adopt the best environmental practices of the leading companies—say, Ben & Jerry's, Patagonia, or 3M—the world would still be moving toward sure degradation and collapse. Hawken writes in *The Ecology of Commerce: A Declaration of Sustainability*: "So if a tiny fraction of the world's most intelligent managers cannot model a sustainable world, then environmentalism as currently practiced by business today, laudable as it may be, is only a part of an overall solution. Rather than a management problem, we have a design problem, a flaw that runs through all business."¹⁷

CHAPTER SEVEN

Poisoning the Grassroots

The people I say are the only competent judges of their own welfare.

AMERICAN REVOLUTIONARY OSIAH QUINCY 1776

The American Revolution viewed "the people" as the sole legitimate source of all government power. Grassroots empowerment was both the means and the end of America's successful rebellion against King George's command empire. It reflected a fundamental shift in thinking. Instead of subjecting the common people to the "God-given authority" of the British monarchy, the Declaration of Independence announced a visionary new doctrine—stating boldly and clearly that the people have the right to "alter or to abolish" any government that does not obey *their* wishes.

At the time of the revolution, neighbors and townfolk participated in grassroots decision making, sharing their opinions with each other directly and through a rich environment of communications forums that included public meetings, political debates, pamphlets like Tom Paine's *Common Sense*, posted broadsides, and newspapers. Democracy was also strengthened by America's good fortune in avoiding the huge gap between rich and poor that existed in Europe.

The truth is, wrote Benjamin Franklin, that though there are in the United States few people so miserable as the poor of Europe, there are also very few that in Europe would be called rich; it is rather a general happy mediocrity that prevails.

Unfortunately, America has changed a lot since Ben Franklin's day. In April 1995, the *New York Times* reported that "the United States has become the most economically stratified of industrial nations."

The wealthiest 1 percent of American households—with net worth of at least \$2.3 million each—owns nearly 40 percent of the

nation's wealth. And the top 20 percent of Americans — live more than 80 percent of the country's wealth — a figure higher than in other industrial nations.¹²

The old joke about the "golden rule" says that whoever has the gold makes the rules. And with the United States entering the 21st century as the most business-dominated nation in the world, it is increasingly clear that social inequality leads naturally to a widening gap between the people and their government. The grassroots democracy that inspired our revolutionary forebears has given way to political elitism, corruption and influence peddling.

In President Clinton's 1995 State of the Union Address he called to the citizenry's alienation from government. Three times as many lobbyists are in the streets and corridors of Washington as were here 20 years ago. The American people look at their capital and they see a city where the well connected and the well protected can work the system, but the interest of ordinary citizens are often left out. Today even the boldest advocates of big business, such as Public Affairs Council President Ray Horing, publicly admit the obvious. There is strong evidence of a system that favors the rich, the famous and the entrenched. Does anyone seriously believe that it is a coincidence that 27 US Senators are millionaires?

The business class dominates government through its ability to fund political campaigns, purchase high priced lobbyists and reward former officials with lucrative jobs. Meanwhile, the working-class majority of the American people has felt its economic and political power diminish or disappear. It has become necessary to work longer and harder to pay bills and earn a living. People have less free time for community involvement and grassroots citizen action. Many of the social institutions that should be the bulwark of grassroots democracy — stable neighborhoods, vigorous unions, independently owned small farms and businesses — are rapidly disappearing. Fewer than half of eligible Americans even bother to vote, and those who do vote have little faith that good will come of it to long politicians they are often voting for the lesser of two evils. Both major parties have become wholly dependent upon the same corporate dollars to pay a new professional class of PR consultants, marketers and social scientists who manage and promote causes and candidates in essentially the same manner that advertising campaigns sell cars, tobacco, drugs and other wares.

Ironically, the dominance of PR in the political process has created an insidious maze problem for the politicians who have come to rely

upon its services. In fact, politicians are held in such low esteem that they often build their election campaigns around the pretense that they are anything *but* professional politicians. Campaign consultants tell their candidates that the best way to win the Washington establishment today is to tell voters that they hate Washington. This tactic is like a drug that has to be administered in stronger and stronger doses. Although it is effective at winning elections for individual politicians, it further feeds the disdain that citizens feel toward the system. Cynicism, alienation and disappointment have created typically attitudes toward government, forcing members of the Washington establishment into increasingly hypocritical self-delusions in order to retain their attachment to power.

This degraded political environment has created a fast bed of business opportunity for the public relations industry. As citizens turn to themselves in disgust from the political process, the PR industry is moving in to take their place, turning the definition of grassroots politics upside down by using rapidly-evolving high-tech data and communications systems to custom design grassroots citizen movements that serve the interests of their corporate clients. Lloyd Bentzer, himself a long-time Washington and Wall Street insider, is credited with coining the term "astroturf lobbying" to describe the synthetic grassroots movements that now can be manufactured for a fee by companies like Hill & Knowlton, Direct Impact, Optima, or the National Grassroots & Communications Project. Becket Cowin, Barson Marsteller Davies Communications or Bonner & Associates. *Campaigns & Elections* magazine defines "astroturf" as "a grassroots program that involves the instant manufacturing of public support for a point of view in which either untrained activists in costume or means of deception are used to recruit them." Lorraine Walker Grunder has coined her own term to describe corporate grassroots organizing. He calls it "democracy for hire."

Astro turf organizing is corporate grassroots at its most devious. Even PR practitioners use the term to describe their company's work, promising that their own grassroots programs are more professional and legitimate. Real Grass Roots—Not Astro Turf—screams a full page ad on the back cover of *Campaigns & Elections* magazine, touting the services of a formerly named National Grassroots & Communications. But "real" in PR terms has a very different definition than its common meaning in the real world. The press release uses the term "real grass roots" to refer to orchestrated mass impress that are so well designed that they look re-

"Total Community Support"

In the old days lobbyists relied on the "three Bs"—boozes, blondes and bimbos—to induce politicians to vote their way on the issues. These venerable persuaders have never been abandoned, but the advance of modern science has developed other methods which are more subtle and often more effective. The public relations industry now possesses something approaching a "unified theory" of the methodology for motivating elected officials.

In the early 1970s writer-infiltrator Susan Trento Hill & Knowlton's Washington office conducted a survey on Capitol Hill to determine the most effective approaches for lobbying. They came in order of priority that old friends, businessmen from the state or congressional district, and ordinary constituents make the biggest impact. Visits are better than letters. Handwritten or personalized letters are better than form letters or preprinted postcards. Letters are better than telephone calls.⁶⁷

Guided by this analysis, Hill & Knowlton executive Robert K. Gray began systematically bring friends and family of prominent Washington politicians. This technique, which is now widely used by industry, was dubbed "grassroots communications" by PR executive Matt Reese, one of the technique's pioneering practitioners in the early 1980s. Until his retirement in 1987, Reese ran Keese Communications Companies, serving clients such as AT&T, Philip Morris, McDonnell Douglas and United Airlines.⁶⁸ Reese touted "grassroots communications" as "the ultimate in corporate legislative advocacy—a bold, unique method of cutting through the special interest tangle to make an industry's message heard...and make the legislator sit up and listen."⁶⁹

To target an individual legislator, Keese Communications said it begins by hiring a "District Liaison" from the ranks of the legislator's influential friends and leading business associates. In addition to having a close personal relationship with the legislator and his/her staff, this person should also be actively involved in the community and have some media contact. Once hired, the District Liaison works to personally lobby the legislator and helps organize a powerful business roundtable whose members are identified and recruited by the District Liaison. This roundtable consists of key business and community leaders—and friends and supporters of the legislator. In other words, we create a kitchen cabinet. These are not just any leaders—but specifically those individuals who are well connected to the legislative target, are receptive to the clients

gates and who may have similar legislative concerns in their own business or industry. Like the District liaison, the roundtable members are recruited from the legislator's business associates, major political contributors and social contacts. Through repetitive, passive contact by friends, acquaintances and influential members of the legislator's home district, the District liaison and members of the roundtable create an artificial bubble of peer influence surrounding the targeted politician so that legislators will get the feel of *total community support* for an issue.

Organizing From the Bottom Up

Politicians rely like anyone else on family and friends for advice and support and they rely on people with money to fund their campaigns. Ultimately, however, they also need votes from the community at large to win election and re-election. Lobbyists therefore need to convince politicians that the masses are desperately concerned about the issue they want passed. By the 1980s PR firms like Hill & Knowlton were developing techniques not only for targeting legislators but also for setting up their constituents. Since then the business of organizing grassroots support for pro-business positions has become a hallmark of our PR industry—one of the hottest trends in politics today, according to former state legislator Ron LaFerriere, now the editor of *Campaigns & Elections magazine*. "In the modern world, few major issues are merely *lobbied* anymore," LaFerriere writes. "Most of them are now managed using a triad of public relations, grassroots mobilization and lobbyists."

Jack Bonner, one of the pioneers in the field of corporate grassroots organizing, is profiled in William Greider's important 1992 book *We Shall Not Be People*. Greider's book assesses a blind clequett-warring American democracy in much deeper trouble than most people wish to acknowledge. Behind the reassuring facade the regular election contests and so forth, the substantive meaning of self-government has been hollowed out. What exists behind the formal shell is a systemic breakdown of the shared civic values we call democracy. The representative system has undergone a grotesque distortion of its original purpose.

Greider described Jack Bonner's grassroots organizing shop located on one of Washington's main boulevards as a "bedroom operation with 500 phones and a sophisticated computer system running telephone surveys approved in each congressional Alcalate voting precinct in the country every two days from 1

America on a variety of public issues, searching for "white hat" citizens who can be persuaded to endorse the political objectives of Mobil Oil, Dow Chemical, Citicorp, Ohio Bell, Miller Brewing, US Tobacco, the Chemical Manufacturers Association, the Pharmaceutical Manufacturers Association and dozens of other clients. This kind of political recruiting is expensive but not difficult. Imagine Bonner's technique multiplied and elaborated in different ways across hundreds of public issues and you may begin to envision the girth of this industry. This is democracy and it costs a fortune.

Tack Bonner, of course, takes issue with Greider's negative opinion of his trade. I see it as the triumph of democracy, Bonner told a writer for the *Washington Post*. In a democracy, the more groups taking their message to the people outside the Beltway and the more people taking their message to Congress, the better off the system is.¹⁴

What puts the lie to Bonner's claim is that his clients are not people but corporations and business trade associations buying the appearance of public support and citizen advocacy. Democracy is based on the principle of one person, one vote. Bonner relies instead on the principle of one dollar, one vote—mobilizing resources that would break the budget of even the best-funded environmental or consumer organization. His services do not come cheap, noted the *New York Times* in 1993. A campaign aimed at a handful of lawmakers on a subcommittee could cost in the tens of thousands of dollars, but one trade association in an uphill fight on the Senate floor paid \$3 million for a single month's work. As Greider points out, Only those with a strong, immediate financial stake in the political outcomes can afford to invest this kind of money in manipulating the governing decisions. Most Americans have neither the personal ability nor wherewithal to compete on this field.

Every Move You Make

The business of grassroots campaigning begins with opinion polling, one of the public relations industry's staple technologies. The science of reliable polling was first developed in the 1930s for businesses aiming by the implications of Franklin D. Roosevelt's landslide election victory—which reflected widespread Depression-era disenchantment with capitalism. Beginning in 1937, the Psychological Corporation, a business established by 20 leading psychologists, began systematic and continuous monitoring of public opinion on questions of political importance to business. At first, polls were used

to gauge the mood of the public at large—but progressive movements have enabled pollsters to zero in on the opinions of narrower and narrower segments of the population.

In the 1950s—notes Canadian author Joyce Nelson—business adapted the techniques of military wargaming—which uses computer technology to run complex simulations of battle, giving numerical weights to factors like population densities, environmental conditions, and weapon deployments to create detailed projections of probable outcomes. Using similar computer models, companies were able to enter their own sets of numbers representing variables such as demographic factors, economic conditions and polling data to generate marketing scenarios.

At the same time that opinion polling was providing an ever more detailed map of the public's collective psyche, computer databases were also evolving in sophistication and ability to track the thoughts and preferences of individuals. The junk mail that arrives at every home every day is generated by "direct marketing"—a science that enables organizations to target their pitches directly to the individuals whose past history shows that they are most likely to respond using computerized lists that track people according to characteristics such as membership in organizations ranging from the ACLU to the Christian Coalition, income, recent change in address, magazine subscriptions, hobbies, attitudes toward crime, ethnic background, buying habits, and religion, to name just a few. Through computerized "merge-purge" techniques, companies can produce hybrid lists—for example, of white Democrat male gun owners who have recently moved, or of upper-income NOW members who subscribe to the *National Review*. By combining this capability with the psychographics it gets generated by opinion polling, corporations can draw a remarkably detailed portrait of you, using the information they do have to make educated guesses about your key attitude on gun control, taxes, nuclear power or any other issue. According to PR executive Robert L. Dilenschneider, Hill & Knowlton subsidiary Reese Communications used this technique a few years ago to help AT&T identify 1.2 million people who actually wrote their senators to raise their phone bills. It was also a question of combining characteristics, values, and geography so that a targeted direct-mail campaign could be waged.¹⁵

This is rocket science, notes its Direct Marketing 1-1—says Mike Mack, vice president of Opt-in Direct, which offers issue communications and grassroots mobilizations to corporate clients. "We

do junk mail and tank phone calls. Everybody hates that stuff but it works. Our two major clients are Philip Morris and the National Rifle Association. You can learn from those two organizations and what they do—they're very efficient, very effective at grassroots.

Like most of today's political wizards, Malik is young but experienced, confident and well compensated. Raised in Iowa, he graduated from Columbia University with a political science degree in 1985, then returned for his masters in business administration in 1991. Malik spent over seven years with Philip Morris developing a grassroots tobacco lobby that he proudly calls "one of the best citizen action grassroots programs in the nation today." In December 1993, he explained how it works at a corporate seminar in Chicago titled "Shaping Public Opinion: If You Don't Do It, Somebody Else Will."

"Mail is what you do when you have more time," Malik said. "The mass of Americans don't care. So you want to find the people who do care, and then you want to find the people who will take action on your side of the issue. You've got to communicate to them in their manner. It's really easy to get lists of people who might be effected by your issue. Build a database today that will track mail response. Follow it up with a phone call, find out where they stand, mark it down in a database so you can target who you want to call again right before a vote."

When an issue is actually coming up for a vote, Malik turns to his phone banks. Phones are for speed. Another advantage of phones is that it's really flexible. You test mail, get results in three weeks, and make adjustments. With phones you're on the phones today, you analyze your results, you change your script and try a new thing tomorrow. In a three-day program you can make four or five different changes. Find out what's really working, what messages really motivate people, and improve your response rates.

Telephones can also be used very effectively to keep targeted legislator with constituent phone calls using patch-thru. It's a contact technique in which a phone bank for a lobbying organization gets one of its supporters on the line and directly connects him or her to the targeted public official to deliver a personal message. Optima Direct has communications switches specifically designed for this purpose. Malik explains: "I'm talking to you, and I say, 'Hey, are you with me on the issue?' and we have a little conversation. You say, 'Yeah, I'll talk to my legislator.' I say, 'Great! I'll connect you now.' You need a shop that has a switch that you can push a button and they are connected and they are off, and you have

operator is on the outboard taking to the next person. That's advanced switches, people."

There are bad patch-through jobs out there, Malik warned sounding like the used car salesman he so much resembles. Optimal Direct, he says, does quality work—patch-through jobs so sophisticated they look like spontaneous manifestations of popular sentiment. Space the calls out throughout the day—it's got to look real, he advises. Talk to your lobbyists and find out what the call-flow patterns are. "Make it look as real as possible."

Onward Christian Soldiers

High-tech, well-funded grassroots organizing is the basis for the remarkable growth of the Christian Coalition, led by boyish-looking executive director Ralph Reed. The Christian Coalition is largely responsible for the swelling tide of Right politics in recent US elections, representing an ungodly alliance of right-wing Christians and corporate America using a high-tech version of the direct-action organizing tactics pioneered in the 1960s by the New Left. Former icon Oliver North, who narrowly missed his bid to become a US senator from Virginia, was one of the rare candidates supported by the right-wing Christian Coalition who failed to win office in 1994 despite massive, tireless, energetic mobilized Christian troops and an angry message that spoke to the bitter mood of American voters.

Reed has become the single most important pro-business activist on the political Right, making him a favorite speaker at conferences sponsored by the Public Affairs Council, the PR industry's leading political association. In February 1994, he joined PR consultants Michael Dunn, Ned Cohen and other speakers at an expensive and exclusive conference held in Sarasota, Florida. You're beginning to see the emergence of genuine grassroots citizen-based movements that I think are going to be the future of American politics in the '90s and into the next century, Reed told the assembled public relations executives from America's biggest companies. He pointed out that both political parties are in irreversible precipitous decline.

The Christian Coalition is filling that void—not with a party, but with what Reed calls "a cause league." By the millennium, the Christian Coalition plans to establish 3,400 county chapters and 175,000 precinct organizations, one for every county and precinct in the United States. Founded in 1990, it already has more than 1.5 million members and 1,200 chapters that are supported by an annual budget of \$20 million. The size of our annual budget and the size of

our mailing list will [soon] exceed that of the Republican Party," Reed predicted. The Coalition plans to build that base by reaching out to two demographic groups—pro-life Catholics and the 24 percent of the electorate who define themselves as born again evangelicals.

The Coalition's success is based partly on technological wizardry. The group's Chesapeake, VA, headquarters are equipped with a phone system capable of generating 100,000 calls in a single week end. Aided by a sophisticated computer system, the Coalition is obtaining the public voting records from every precinct in the United States—records that often include a history of which elections a voter has participated in and, if they voted in a primary, whether they picked a Democratic or Republican ballot.

The Coalition provides each of its 1,200 chapters with the computerized voter rolls for their county. Using those lists the chapters build what Reed calls "a voter ID file." Volunteers and hired workers (who are paid \$5 per hour and must meet a quota) call each voter in the county and ask three questions. First, voters are asked whether or not they are in favor of raising taxes, a question that identifies economic conservatives. Next they are asked about abortion; this identifies who is pro-life or pro-choice. Third, voters are asked what is the most important issue facing their community, and that response is coded as belonging to one of 45 identified hot button issues, such as crime, homosexuality, and humanism.

Reed explained that the Coalition's success is based on the group's realization that its potential supporters are not a monolithic voting bloc. For example, many evangelicals will not respond to an anti-abortion argument, but can be reached with an anti-tax message. Armed with these ideological IDs on each voter, Christian Coalition-backed candidates can generate elaborate direct-mail campaign appeals. "There is no replacement for knowing what somebody cares about," said Reed.

As an example, Reed told the assembled PR executives how the Christian Coalition had success in targeting Sonny Stalings, an up-and-coming Democratic state legislator from Virginia Beach. In 1991 there was a state senator, Stalangst that we did not care for, the business community did not care for and the National Rifle Association did not care for. "He was positioning himself to run for attorney general in Virginia two years hence," said Reed. "None of us together could afford to take the chance that he might be elected because in Virginia attorney general is a nice stepping stone to governor. So we figured it would be a lot cheaper to move him back

to his law practice in a state senate race than it would be to do it in a statewide race."

So Reed and company working stealthily nipped Stallings' political ambitions in the bud and helped a Christian Republican Ken Stelle capture his seat. First, the Coalition surveyed the electorate and discovered that the No. 1 issue concerning district voters was the city's inadequate water supply. Second, the Coalition helped Stelle, who represented the more conservative pro-family and pro-business viewpoint, send out personalized letters to potential voters.

The letters arrived the Saturday before the election. To those who had voiced concern about water, Stelle declared himself to be the water candidate. To those voters who said crime was the most important issue, Stelle was packaged as the crime candidate—and so on. Consequently the Coalition, by picking and then exploiting the right issues, was able to elect Stelle, a right-thinking Republican to a seat that Democrats had held since Reconstruction.

Reed also offers his Coalition's services to help corporations mobilize citizens on issues that go beyond the Christian Coalition's array of evils: abortion, condoms and secularism. He acknowledged that many of the PR executives gathered in St. Paul didn't share his views on these subjects. They could agree to disagree, but there were other areas of common ground, such as environmental issues, especially if a corporation is involved in getting a lot of harassment from activists. The Christian Coalition also did its part to defeat Clinton's 1993 health care reform proposal. Reed told of plans to drop into 600,000 evangelical churches 32 million postcards that have a picture of a 4-year-old child getting a shot. The caption under the picture read: "Don't let a government bureaucrat in this picture."

Democratic Centralism

Like the Christian Coalition, corporate grassroots strategies are designed to mobilize the masses in political camping as well as keeping effective control of national political debates concentrated in the hands of a select few. Speaking at the same conference as Reed, Neil Cohen, the director of political support services at APCO Associates in Washington, explained the relationship between broad-based membership and tightly centralized decision-making: Broad-based membership is: What does the public see? What do the legislators see? Decisions making is a core group of three or so people who have similar interests and who are going to get the job done and not veer off."²³

Another speaker, Michael Dunn of the Washington-based PR firm Michael F. Dunn and Associates, agreed. The purpose of the grassroots program is *not* to get more Americans involved in the political system. Dunn explained: "The purpose of a grassroots program is one purpose period, and that is to influence legislative policy. The reality is you are going to be involved in this political process whether you want to or not. The only real question is whether or not you are going to win. And if you do not have a grassroots program your odds of winning have seriously diminished."

Fortunately, Dunn said, corporations can use the same technology as the Christian Coalition. First, companies must systematically build a political propaganda effort targeted at their employees, retirees, vendors and customers. The aim of this indoctrination is to make the majority of employees at each corporate outpost sensitive to the impact government has on what they are trying to do and to realize they've got to play a role in that whole program. To complement this broad-based indoctrination program, he urged companies to set up a "key contact program" that recruits employees from each corporate outpost to develop a personal relationship with the elected official to whom they are assigned. In order to have a quality relationship that key contact has to basically be willing to integrate into that lawmaker's political organization, and become part of their political campaign apparatus, be a part of the social circle of which that lawmaker is a part," said Dunn, describing much of his grassroots strategy. Employees are being told, in short, that to keep their jobs and rise within the company, they should become political operatives for the company, befriending candidates and becoming the grassroots eyes and ears for the corporation in local parties. Dunn even advocated putting this "key contact responsibility into a job description."

Dunn didn't discuss, of course, how the company would deal with employees who fail to get with the program. But such a possibility touches on issues of political liberties and the integrity of democratic institutions. Dunn's system of grassroots mobilization is in fact a top-down command system, under which employees are expected to vote and argue not for what they as free citizens consider politically good or desirable but for the political interests of the company that employs them. Dunn sees these "grassroots agents" as corporate soldiers whose every move is essential for victory in today's competitive environment. This is a bitter truth. There is a German general who once said politics is war without borders. And if you

think you're not in a war right now, you have not been in the trenches yet. This is a war," he thundered. Ultimately every organization in America has to move to a broad-based program. Until we get all of our people involved in understanding, we are going to continually lose the political marketplace.

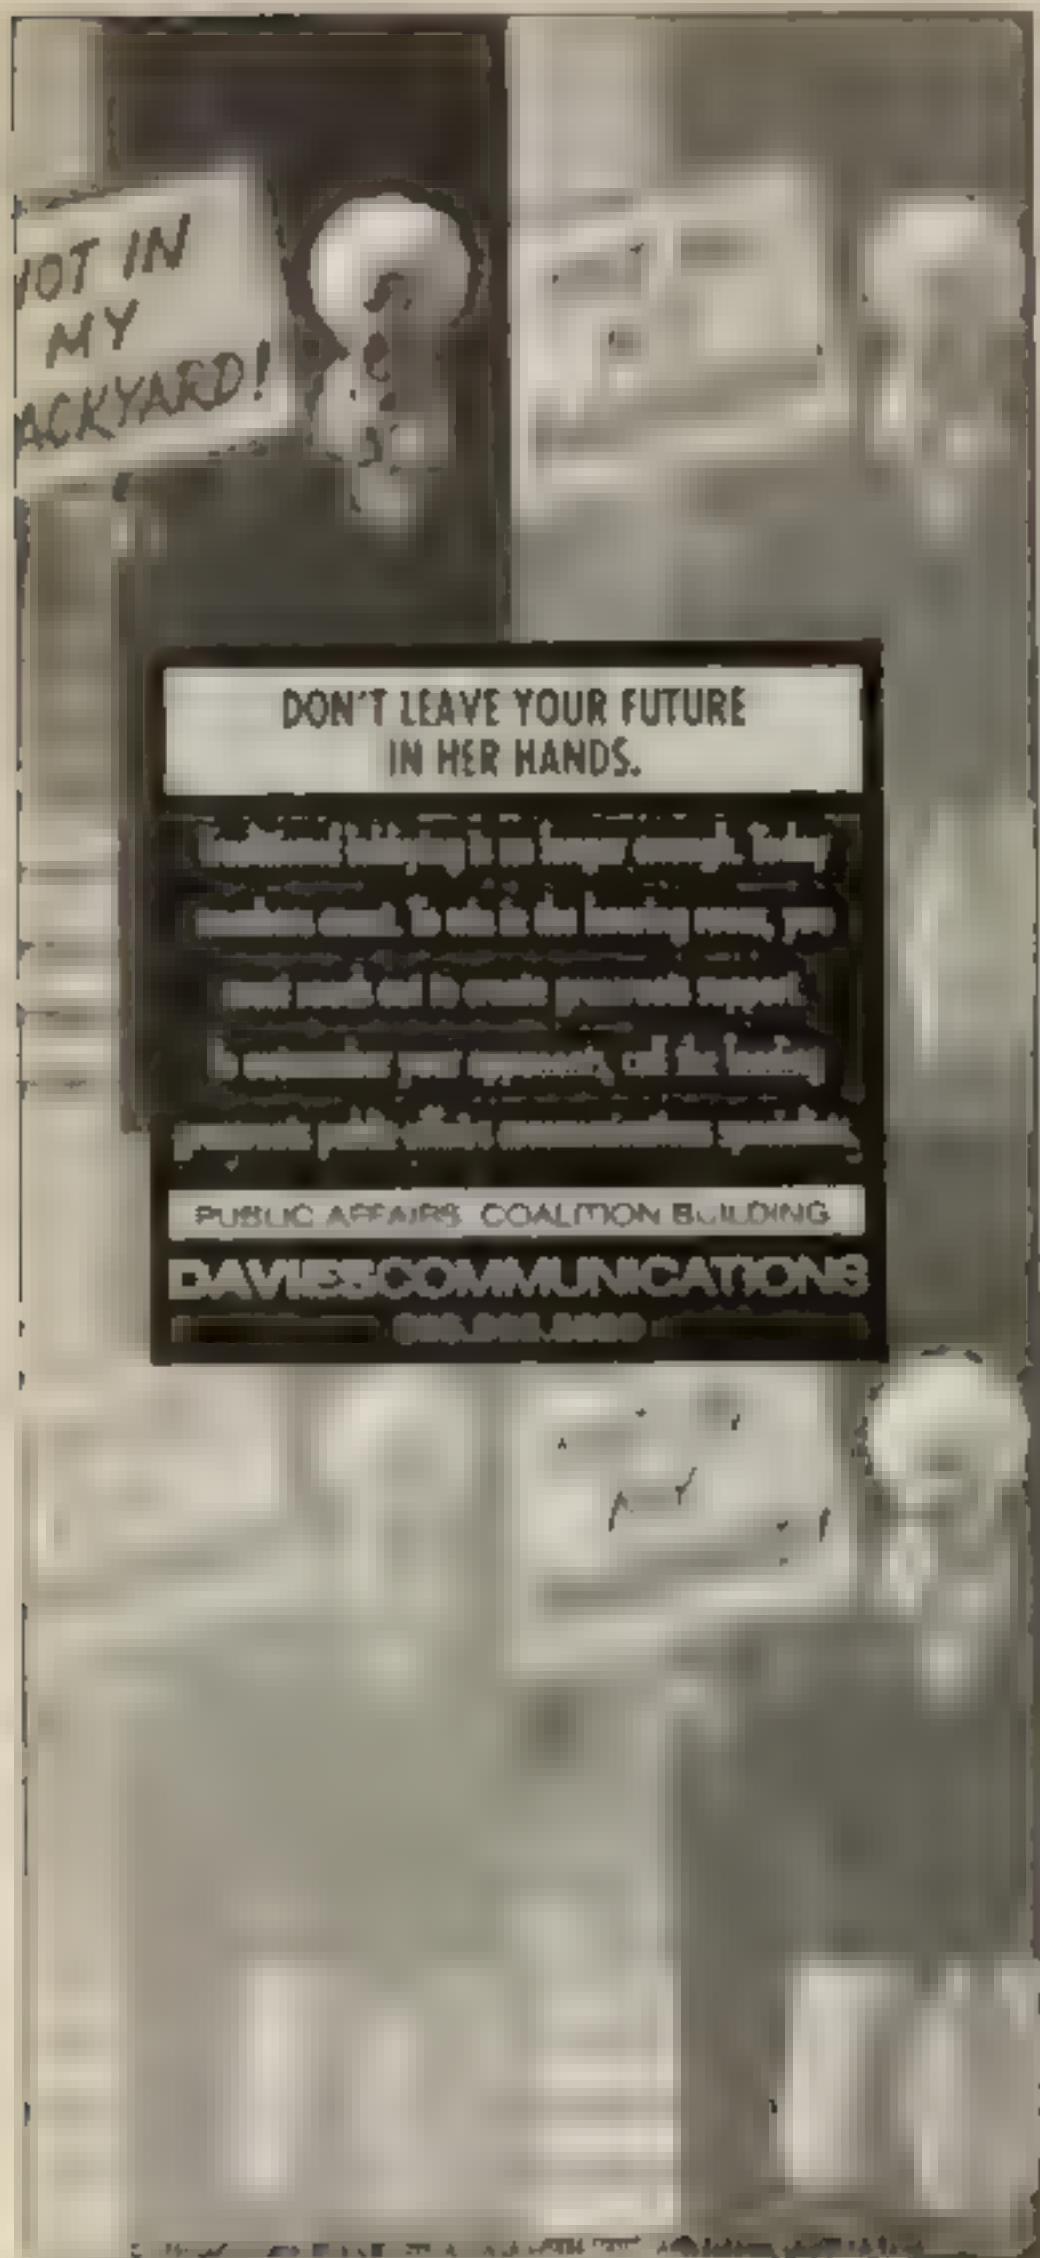

Stick It Up Your Back Yard

Grassroots organizing is industry's weapon of choice against NIMBY—or Not In My Back Yard—movements. Local community groups that organize to stop their neighborhood from losing a toxic waste dump, porno bookstore or other unwanted invader. NIMBYs are the "white blood cells" of the democratic body politic—small, quickly mobilized and effective at killing off foreign intrusions. Like white blood cells, they sometimes attack harmless or even beneficial newcomers, but they are authentic and deeply felt expressions of democracy reflecting the right of citizens to shape their own environment and destiny.

John Davies helps neutralize these groups on behalf of corporate clients including Mobil Oil, Hyatt Hotels, Exxon, American Express and Pacific Gas & Electric. He describes himself as "one of America's premier grassroots consultants" and runs a full-color advertisement designed to strike terror into the heart of even the bravest CEO. It's a photo of the enemy—literally a little old white-haired lady holding a hand-lettered sign that reads "Not In My Backyard!" A caption imprinted over the photo says: "Don't leave your future in her hands. Traditional lobbying is no longer enough." To outnumber your opponents, call Davies Communications.

Davies' promotional material claims that "he can make a strategically planned program look like a spontaneous explosion of community support." Davies has called grassroots communication "the most potent S&P tool." At a PR conference in December, PR pro Davies said his clients use it effectively when they really need a friend. "A local community is going to shut down your business and you call up a public affairs firm and say, 'Oh, said Mark Twain' said it best. 'When you need a friend, it's locate to locate.'

Davies' most effective tricks for neutralizing corporate critics by using mailing lists and computer databases to identify potential supporters. He explained how his telemarketers can pressure supporters to what appears to be a voiceless concerned citizen to pen a personal letter to a publication, newspaper per city congressional. "We want to assist them with letter writing. We get them on the phone and write

DON'T LEAVE YOUR FUTURE
IN HER HANDS.

Traditional lobbying is no longer enough. Today's battles count. To win in the hearing room, you must speak out to earn grassroots support. To expand your opportunity, call the leading grassroots public affairs communication specialists.

PUBLIC AFFAIRS COALITION BUILDING
DAVIES COMMUNICATIONS
1-800-333-5000

"The enemy" as seen in a copyrighted commercial message by the PR firm Davies Communications. This ad appeared in the December/January 1995 issue of *Campaigns & Elections* magazine, which was dedicated to the topic of corporate grassroots lobbying.

were on the phone we say "Will you write a letter? Sure! Do you have time to write it?" Not really. Could we write the letter for you? I could put you on the phone right now with someone who could help you write a letter. Just hold, we have a writer standing by. The call is then passed on to another Davies employee who creates what appears to be a personal letter to be sent to the appropriate political office. If they're close by we hand-deliver it. We hand-write font on little kitty cat stationery if it's a little old lady. It's a business we like it over to be photocopied on someone's letterhead. We use different stamps, different envelopes... Getting a pile of personalized ones that have a different look to them's what you want to strive for**

Barry Whitney, the CEO of National Grassroots & Communications, also specializes in fighting local community groups. My company basically works for major corporations and we do new market entries. Wal-Mart is one of our clients. We take on the NIMBYs and environmentalists. National Grassroots also assists companies who want to do a better job of communicating to their employees because they want to remain union-free. They need guidance how to do it so we go in and set that up.

Whitney began her political career as a staffer in Democratic Senator Ed Muskie's press office in 1969, then gravitated to covering advocacy work for the Barnum & Bailey Circus where she learned the value of a visual. There's nothing better than a guy walking behind an elephant to make the evening TV news. It was great training for me. In 1980 Whitney joined the nation's second largest PR firm, working for corporate America to defeat legislation that was proposed. At the same time I was married to a member of Congress [Pennsylvania's Peter Kostmayer] who was in the pocket of unions. Notwithstanding the contradiction, Whitney campaigned aggressively for her husband, showing 27,000 cards in 11 days in Pennsylvania, competing on the front pages. Between that and my experience with Motorists Against Drunk Driving I quickly earned a niche of grassroots support.*

National Grassroots specializes in passing and defeating legislation at both the federal and state level, setting up its own organizations using a network of protesters, grassroots organizers. We believe very strongly in having a word we term *radicalism* and the greatest. One of the things we don't like to emphasize is history. They are not part of the community. We find local individuals who know the community inside and out, the community values and

then we work with them. They report to us. They are on our payroll, but it's for a very small amount of money.

Who are these on-the-cheap organizers for later? We have found that our best community ambassadors are women who have possibly been head of their local PTA; they are very active in their local community—or women who are retired and who have a lot of time on their hands. We find them to be the very best activists. To supervise these grassroots grannies, Whitney hires professionals who have had field organizing experience—on electoral campaigns, operatives who can drop in the middle of nowhere and in two weeks they have an organization set up and ready to go.

When outside organizers are sent in, they dress carefully to avoid looking like the high-priced, out-of-town hired guns that they really are. It's important not to look like a Washington lobbyist, Whitney explained. When I go to a zoning board meeting I wear absolutely no make up. I comb my hair straight back in a ponytail and I wear my kids' old clothes. You don't want to look like you're someone from Washington, or someone from a corporation.... You want very much to fit in with the env comment. Wearing a baseball cap is how you fit in; that's how you're one of them instead of somebody from the outside coming in.... People hate outsiders, it's just human nature."²⁰

Not In Our Bottom Line

The growing proliferation of phony grassroots groups prompted a May 1991 article titled "Public Interest Pretenders" in *Consumer Reports* magazine. That group with the do-good name may not be what it seems, warned the magazine. There was a time when one usually could tell what an advocacy group stood for—and who stood behind it—simply by its name. Today, councils, coalitions, alliances, and groups with citizens and consumers in their names could as likely be fronts for corporations and trade associations as representatives of citizens or consumers. These public interest pretenders work in so many ways—through advertisements, press releases, public testimony, bogus surveys, questionable public opinion polls, and general disinformation—that it's hard to figure out who's who or what the group's real agenda might be.

As an example, *Consumer Reports* pointed to the Workplace Health & Safety Council, which is actually a lobbying group composed of employers and it has opposed a number of regulations aimed at strengthening worker safeguards. Similarly, someone

looking at the logo of the National Wetlands Coalition—which features a duck flying over a marsh—would have no clue that the coalition is made up mainly of oil drillers, developers, and natural gas companies. Today inventing phony citizens groups is an industry in its own right. Public relations specialists have discovered countless ways to create at least the illusion of citizen involvement.

The auto and oil industries are also active in grassroots organizing. *Consumer Reports* noted that the American Petroleum Institute retained the Beckel Cowan PR firm in 1989 to organize Americans Against Unfair Gas Taxes, a national organization with over 15,000 members that helped kill a proposed hike in the federal gas tax. In Nevada, the auto industry created a front group called Nevadans for Fair Fuel Economy Standards to impress Nevada Senator Richard Bryan. A PR firm called the FMR Group worked to find Nevadans who owned "gas guzzlers" and spread the word that a law supported by Bryan to foster greater gas efficiency would make such vehicles unaffordable. FMR recruited 20 Nevada residents, put their names on the group's letterhead, and sent letters to organizations and individuals asking them to write Senator Bryan. The letters to constituents didn't mention the auto industry's sponsorship.

Insurance companies are also mobilizing according to Barbara Bey, the managing director of public affairs at the American Council of Life Insurance in Washington, a trade association of more than 600 companies. Bey was also the Public Affairs Council's 1998 chairperson. Bey told *Impact*, the Council's monthly newsletter, "Now the American Council of Life Insurance is preparing for action. Technology is what allows us to do it and do it efficiently—and do it well," Bey said. "We're building an interactive database for grassroots use in exploring concerns to members, legislators and other stakeholders before these concerns escalate into issues. We are also developing a key contact program to expand and take the grassroots, together, to 'the next step'."³³

There is just no substitute for grassroots campaigns, according to Eric Remond, the director of public policy communication at the Hartford Insurance Group. Remond told *Impact*, "In atypical organization such as ours, when the local general manager works with employees to sit down and write letters to the legislators, it's often done right there at work. The employee is given the paper, the pens, the stamps and the envelopes. Afterwards, copies are made so we know what kind of response we have received. Because we don't feel comfortable doing that with our customers, we don't know

what proportion of them actually responded or along what lines. And that is where grassroots mobilization comes in. These days [sic] become continued corporate grassroots campaigns to point that we knock on more and more doors, the doors of our customers, distributors, suppliers, related industries and other members of our 'extended family.''"

Robert C. Kirkwood, the director of government affairs at Hewlett Packard, is another true believer. He told *Impact*: "We had an epiphany . . . in the NAFTA effort. For the first time, we went to a widespread grassroots program that involved employees throughout the country. My sense is that we will use that as a part of our regular arsenal. . . . The environmental movement will be upset. Labor will be troubled. Everyone hasn't cooled up yet, but they will."

Amputating Health Reform

During the 1992 presidential campaign, opinion polls showed that voters were especially concerned by skyrocketing costs for health care. Candidate Bill Clinton talked frequently about his interest in a managed competition approach to health reform. In fact, observes James Fallows in the January 1993 issue of *The Atlantic*, demand for health reform was so strong that through most of 1993 the Republicans believed that a health reform bill was inevitable—and they wanted to be on the winning side. U.S. Senator Bob Dole said he was eager to work with the Administration and appeared, if events were to go his way, side-by-side with Hillary Clinton to endorse universal coverage. Twenty-three Republicans said that universal coverage was a given in a new bill.

Critics have pointed to numerous flaws in the Clinton Administration's health care proposals. In a democratic system, however, flawed initial proposals are common—perhaps even inevitable. A healthy debating process brings together people from differing perspectives to debate and revise plans until a consensus emerges. In the case of the Clinton health plan, however, astroturf furies—funded primarily by the insurance and drug industries—managed to just the debate in its entirety, crushing not only the Clinton plan but all proposed alternatives for reforming the U.S. health care system. What had been the centerpiece of the Clinton administration's domestic policy was relegated to the dustbin of political history. By 1995 the issue was not even on the political map.

The last straw in the campaign was fired in 1993, when the Clinton administration attacked high prices for prescription drugs and

unted at the possibility of government imposed price controls. In response, the pharmaceutical industry hired the Beckel Cowan PR firm whose principals had managed the Mondale for President campaign. Beckel Cowan created an astroturf organization called Rx Partners and began deploying state and local organizers to, in the words of a company brochure, "generate and secure high-quality personal letters from influential constituents to 35 targeted Members of Congress." Simultaneously, Beckel Cowan managed a targeted mail and phone campaign which produced personal letters, telegrams and patch-through calls to the targeted Members' local and Washington DC offices. The firm claimed that the campaign generated in excess of 50,000 congressional contacts and built an extensive network of supporters in 35 congressional districts and states.¹

Robert Hoopes, who also started his career working for liberal Democrats, was another key player in the PR campaign against health care reform. In 1986, Hoopes was a college freshman when he picked up a *Time* magazine, saw Michael Deaver on the cover, and decided, "I want to be a lobbyist because this looks like a great job. You sit in the back of a limousine, you're on the phone, you've got a view of the Capitol, and get paid big bucks." In pursuit of this dream, Hoopes went to work for liberal Democrats including Senators Joe Biden and Christopher Dodd. In 1992 he worked for the Clinton/Gore campaign. In October 1993, he was named the first grassroots coordinator for political education specialist for the the 300,000 member Independent Insurance Agents of America (IIAA). According to Hoopes, the IIAA has made grassroots lobbying "the cornerstone of our public affairs agenda since 1987," making it the primary cited model for lobbyists in other industries.²

"Health care was a very slow moving train," Hoopes said. "We saw it coming in Clinton's State of the Union address. We had time to gin up the grassroots, mail our letters, educate our members, go to town hall meetings. I could travel all over the country and get my members excited about it. When it came time for a vote we were ready." According to *Campaign Politics* magazine, the IIAA invited nearly 14,000 insurance agents during the health care debate, becoming what Hoopes describes as a new breed of Washington lobbyists. The new lobbyists, good lobbyists, were impressed party tacky name tags and are in the Capitol to represent themselves. "300,000 independent insurance agents across the country. Our [Washington] lobbyists have behind them an army of independent insurance agents from each state, and members of Congress

understand what a lobbyist can do with the touch of a button to mobilize those people for or against them. This change is a direct result of technology."⁵⁹

The Coalition for Health Insurance Choices—an insurance industry front group—led the effort to kill health reform. The Coalition admitted that it received major funding from the National Federation of Independent Businesses (NFIB) and the Health Insurance Association of America (HIAA), a trade group of insurance companies. According to *Consumer Reports*, "The HIAA doesn't just support the coalition; it created it from scratch."⁶⁰

The Coalition's mastermind was Bill G. Childs, who has been organizing grassroots support for the insurance industry for a decade. From 1986-89 he orchestrated a media, grassroots, and coalition-building campaign for the industry's American Tort Reform Association. Then he moved to ActuaLife and Casualty where he instituted one of the most sophisticated corporate grassroots systems in the nation. He wasn't the only PR genius behind the initiative; his campaign, but his coalition can honestly claim the kill. Through a combination of skillfully targeted media and grassroots lobbying, these groups were able to change more minds than the President could despite the White House bully pulpit. "Never before have private interests spent so much money so publicly to defeat an initiative launched by a President," states Thomas Sculley in an article titled "Killing Health Care Reform" in *Campaigns + Elections magazine*.⁶¹

In 1993 Childs recalled, "The insurance industry was very nervous. Everybody was talking about health care reform.... We felt like we were looking down the barrel of a gun. Forming coalitions, he explained, is a way to 'provide cover for your interest.' We needed cover because we were going to be painted as the bad guy. You also get strength in numbers. Some have lobby strength, some have grassroots strength, and some have good spokespersons.... Start with the natural strongest allies, sit around a table and boil it up to give your coalition a positive image." For the health care debate his coalition drew in "everyone from the homeless Vietnam veterans... to some very conservative groups. It was an amazing mix and they were all doing something."

Instead of forming a single coalition, both reform opponents used opinion polling to develop a point-by-point list of weaknesses in the Clinton administration proposal and organized over 20 separate coalitions to hammer away at each point. Increasing your

election — use words that you've identified in your research. Clicks said: "There are certain words that have a general positive reaction. That's where focus group and survey work can be very beneficial." Fairness, balance, choice, condition, and alliance are all words that resonate very positively. The Coalition for Health Insurance Choices (CHIC), for example, focused on opposing the Clinton plan's proposed mandatory health insurance.

To drive home the message, CHIC sponsored a now legendary TV spot called "Harry and Louise," which featured a middle-class married couple lamenting the complexity of Clinton's plan and the creation of a new billion-dollar bureaucracy. The ad was produced by Good and Gluskin First Tuesday, a PR and election campaign management firm that has worked for liberal Democrats, including the presidential campaigns of Gary Hart, Bruce Babbitt and Jesse Jackson. According to Robin Toner writing in the September 30, 1994 *New York Times*, Harry and Louise symbolized everything that went wrong with the great health care struggle of 1993. A powerful advertising campaign financed by the insurance industry that played on people's fears and helped derail the process.¹⁴

CHIC and the other coalitions also used direct mail and phoning coordinated with daily doses of misinformation from radio blowtorch Rush Limbaugh to spread fears that government health care would bankrupt the country, reduce the quality of care one could obtain for people who wanted to stick with their family doctor.

Every day 20 million Americans tune in and turn on to the Limbaugh talk radio show, which is aired on 650 stations across the United States. However few people realize the degree of technically sophisticated orchestration behind Limbaugh's power. One key element was his common use of paid ads on the Limbaugh show to generate thousands of citizen phone calls urging legislators to kill health reform. Rest would whip up his listeners' fears with a dedicated rant against the Clinton health plan. Then during a commercial break listeners would hear an interalker cue'd and an 800 number to call for more information. Calling the number would connect them to a telemarketer who would talk to them briefly and then pitch them through directly to the congressperson's office. The congressional staffers fielding the calls typically had no idea that the constituents had been primed, jaded, and baited at them by radio ads on the Limbaugh show, paid by the insurance industry, with the goal of orchestrating the appearance of overwhelming grassroots opposition to health reform.

That's a very effective thing on a national campaign and even in a local area if the issue is right," Chodz said. He said this tactic is now widely used, although few will discuss the technique.¹

Chodz also stepped in to provide corporate resources where members of the coalition were unable to do it themselves. "With one group we wrote a large portion of their direct mail package which went out to 1.5 million people and generated hundreds of thousands of contacts. We worked with a number of business trade associations to finance fly-ins to Washington, DC, where people lobbied their Representatives. In some cases we funded them entirely; in some cases funded part of them; in others we didn't have to fund; we just provided the background and message. In other cases we actually wrote the stuff. With our coalition allies in some cases we were totally invisible. We actually ended up funding some advertising that our election partners ran under their names, mostly inside the Beltway to effect lawmakers thinking."²

By 1994 the barrage had substantially altered the political environment, and the Republicans became convinced that Clinton's plan—an plan—could be defeated. Their strategist William Kristol wrote a memo recommending a vote against any Administration health plan sight unseen. Republicans who previously had signed on to various components of the Clinton plan backed away. GOP Senator Robert Packwood, who had supported employer mandates for twenty years, announced that he opposed them in 1994, telling the *National Journal* to comment that Packwood "has assumed a prominent role in the campaign against a Democratic alternative that looks almost exactly like his own earlier policy prescriptions." In desperation George Mitchell, the Democratic Party's Senate majority leader, announced a scaled-back plan that was almost pure symbolism, with no employer mandates and very little content except a long-term goal of universal coverage. Republicans dismissed it with fierce scorn.

In 1994 notes author James Fallows, the *Wall Street Journal* tested the reaction of a panel of citizens to various health plans, including the Clinton plan. First they tried describing each plan by its contents alone and found that the panel preferred the Clinton plan to the most alternatives. But when they explained that the preferred group of provisions was in fact the Clinton plan, writes Fallows, most members of the panel changed their minds and opposed it. They knew after all that Clinton's plan could never work.³

CHAPTER EIGHT

The Sludge Hits the Fan

The major public acceptance barrier which surfaces in these US studies is the widely held perception of sewage sludge as malodorous, disease-causing or otherwise repulsive. There is an additional component to public attitudes about sludge which means that public education will not be entirely successful.

US ENVIRONMENTAL PROTECTION AGENCY
1981 public relations document

The German politician Otto von Bismarck once said that those who love sewage and the raw should never watch either being made. Something similar might be said about the process we've gone through in writing this book. Like Dr. Strangelove, we knew we wanted to write an expose of the PR industry but our publisher felt that using "public relations" in the title would put people to sleep. His advertising firm he required that we furnish a title before the manuscript was actually finished. We went through weeks of constant transforming in search of a title that would sell public relations without actually using those words. We scoured the names for interesting places and begged friends to ask how they felt about titles such as *The Hidden Manipulators Hack Track Sound Bytes Hack on the Side of the Public Mind*. We seriously considered lifting the title from Arnold Schwarzenegger's 1984 film *True Lies* or from J. Edgar Hoover's classic 1954 anti-communist classic, *Masters of Deceit*.

Our final title was borrowed from the Tom Ten cartoon reprinted in chapter one. We tried it on a friend who thought *Love Sludge Is Good For You* sounded too weird to be taken seriously but our publisher felt it would stick in people's heads and make the book easier to market. In the end, therefore, our decision has cost

down to commercial calculations. We weren't planning to write about toxic sludge per se. We were trying to reach so-called Generation X readers with a "Generation X" title—a cynical, exaggerated parody of deceptive public relations.

Then Nancy Blatt called, and we discovered that our "parody" is no exaggeration.

Nancy Blatt is an aggressively perky woman who serves as Director of Public Information for the Water Environment Federation (WEF). She phoned to say that she had seen an advance notice mentioning our book, and she was concerned that the title might interfere with the Federation's plans to transform the image of sewage sludge. "It's not toxic," she said, "and we're launching a campaign to get people to stop calling it sludge. We call it biosolids. It can be used beneficially to fertilize farm fields, and we see nothing wrong with that. We've got a lot of work ahead to educate the public on the value of biosolids." Blatt didn't think the title of our book would be helpful to her cause. Why don't you change it to *Smoking Is Good For You*, she suggested. That's a great title. People will pick it up. I think it has more impact. You can focus in on all the Philip Morris money. I think it's a grabber."

We thanked her for the suggestion, but explained that we don't want our book to be confused with Christopher Buckley's hilarious satire of the PR industry, titled *Thank You For Smoking*.

Blatt took pains to insist that I am not a flack for an interest that I don't believe in personally. She said she shared our dim view of PR representatives working to promote tobacco and other harmful products. She said the Water Environment Federation works to promote recycling by applying the nutrients in sewage waste to fertilizer to farm fields, a natural process that returns organic matter to the soil and keeps it from polluting water supplies.

We were concerned that you might have heard some negative things about the campaign planned by our PR firm, Powell Tate. Blatt said,

That caught our attention. Powell Tate is a bad-clip Washington-to-busy-DC lobby firm that specializes in public relations around controversial litigation, safety and health issues, with clients from the tobacco, pharmaceutical, electronics and auto industries. Tony Powell was President Jimmy Carter's press secretary and confidant. Steven Tate similarly served Vice President George Bush and First Lady Nancy Reagan. Tate is also the chairperson of the Corporation for Public Broadcasting.

Realizing we might be on to something, we asked Nancy Bent to send more information about the Water Environment Federation. She dutifully mailed a glossy brochure and some other promotional materials, along with a letter reiterating her concern that our book might do a disservice to the public and the environment. Her cooperation quickly turned to stonewalling, however, when we requested strategy documents, memos, opinion surveys and other materials from Powell Tate. Legally we are entitled to these documents since the Water Environment Federation is partially funded at taxpayer expense. WEF's refusal to voluntarily produce them forced us to file a Freedom of Information Act request with the federal government. As this book goes to press, the EPA is still stalled on our information request.

Our investigation into the PR campaign for "beneficial use" of sewage sludge revealed a murky tangle of corporate and government bureaucracies, conflicts of interest, and a coverup of massive hazards to the environment and human health. The trail began with the Water Environment Federation — formerly known as the Federation of Sewage Works Associations — and led finally to Hugh Kaufman, the legendary whistleblower at the hazardous site control division of the Environmental Protection Agency.

In the 1980s, Kaufman refused to remain silent about the collaboration between EPA officials and leaders of the industries they were supposed to regulate. His courageous testimony exposed the agency's failure to deal with mounting chemical wastes and brought down Anne Burford, President Reagan's EPA administrator. His active protest resulted in a secret campaign to track his whereabouts and find evidence to fire him, report Myron Peretz Gizer and Penina Algoal Gizer in their 1989 book, *The Whistleblower*. The EPA's inspector general became implicated in this scheme. Silencing Kaufman became official policy even if it meant invading his privacy in the futile hope of uncovering some personal indiscretion. Kaufman gained national prominence and became a symbol of an employee who refused to be cowed by an oppressive bureaucracy.

Today, Kaufman is attempting to raise a similar alarm about the so-called "benign" use of sewage sludge. A boondoggle he refers to as "sludge gate" — the mother lode of toxic waste —

A Brief History of Slime

Prior to the twentieth century, indoor plumbing was in almost unheard-of luxury. Common people used outdoor wells that

wealthy used a primitive indoor system—bedpans which were carried away by servants. In either case, the waste ultimately returned to the soil near its point of origin. In traditional agriculture, such as human waste was prized as a prime ingredient in what the Chinese called night soil—an fully composted high-grade fertilizer.

Things changed with the industrial revolution which brought people together in congested cities far away from farms where composting and recycling were no longer practical. Open gutters were dug to carry sewage from city streets into nearby bodies of water. When populations were small and water supplies seemed unlimited, the wisdom of using fresh water as a vehicle in transport for human waste was not questioned. By the 1920's and 1930's large cities were piping large quantities of untreated sewage into rivers and oceans creating serious pollution problems. Septic systems in thousands of small and medium sized communities were failing due to overloading. Thousands of industries were also producing chemical wastes and needed to dispose of them.

The environmentally sound approach would have been to develop separate treatment systems for human and industrial waste. Biological wastes should have been recycled through a system that returned the nutrients to the soil and businesses should have been required to separately treat their chemical wastes on-site so that they could be contained and reused within the industries from which they came. At the time, however, it seemed easier and cheaper to simply dump everything into a single common sewer system. For businesses, the system provided tax-based aid to help them dispose of their toxic byproducts. For people, indoor plumbing gradually ended everything awful—was clearly that marked their escape from frontier hardship and their entrance into modernity. The system helped limit the spread of communicable diseases and for many it symbolized the difference between primitive cruelty and the civilized benefits of technological society.

The problem with this system, however, is that it collects wastes and concentrates a wide range of noxious and toxic substances which are then very difficult if not impossible to separate and treat. According to Abby Rockefeller, a plantarepost and key worker of waste treatment reform, "conventional wastewater treatment systems are not designed to produce usable end products because it is so. It must be said that failure to solve the eventual problem of pollution caused by the waste materials received by these systems is the function of their design."¹⁴

Today—observe environmental writers Pat Costner and Joe Thornton—waterless treatment systems—on-site composting and drying toilets that process human wastes directly into a safe, useful soil additive—are available. These dry systems are more economical than water flushed toilets and their attendant collection and treatment systems. However, water flushed toilets are so entrenched in the cultural infrastructure that the transition to alternative waste systems has been blocked. Instead, billions of dollars are spent on perfecting the mistake of waterborne waste systems: wastes are first diluted in water and then, at great expense, partially removed. The products of this treatment are sludge—which requires even further treatment before disposal—and treated effluent which carries the remaining pollutants into receiving waters.⁵

To cope with the mounting problem of water pollution, the United States launched what has become the largest construction grants program in US history, linking millions of homes and tens of thousands of businesses into central treatment facilities. As the 1970s dawned, front page headlines across America told stories of polluted drinking water and quarantined beachfronts. Pressure from environmentalists spurred Congress to pass the Clean Water Act of 1972, which according to US Senator Max Baucus, "put us on the course to fishable and swimmable rivers at a time when one river was known as a fire hazard and others hadn't seen fish in a generation." The Clean Water Act required communities to make sure that by 1977 their sewage plants could remove at least 85 percent of the pollutants passing through them, and allocated funding to pay for the additional treatment and filtering technologies needed to achieve this goal. By 1976, the federal government was spending \$50 billion per year to help cities achieve water purity goals.⁶

In the 1980s, however, politicians responded to pressure for reduced federal spending by cutting funds for water treatment and by the 1990s the money had been virtually eliminated.⁷ In the meantime, the push for clean water had created another problem: tons of pollution-laden sewage sludge generated as a byproduct of the treatment process.

According to Abby Rockefeller, the hundreds of billions of dollars spent pushing water through central sewage processing plants has largely been wasted. Leaving aside the immense costs of this option both in energy and in money, there is the critical though largely unrecognized problem of the sludge. Rockefeller sees "the more advanced the treatment of the sewage (the more successful the

separation, the more sludge will be produced—and the worse—the more unusable and dangerous—it will be. That is the better the treatment, the greater the range of incompatible materials that will have been concentrated in this highly entropic gray area.

Secret Ingredients

The *Harper Collins Dictionary of Environmental Science* defines sludge as "a viscous semisolid mixture of bacteria and virus-laden organic matter, toxic metals, synthetic organic chemicals, and settled solids removed from domestic and industrial waste water at a sewage treatment plant." Over 60,000 toxic substances and chemical compounds can be found in sewage sludge, and scientists are developing 700 to 1,000 new chemicals per year. Stephen Lester of the Citizens Clearinghouse for Hazardous Wastes has compiled information from researchers at Cornell University and the American Society of Civil Engineers showing that sludge typically contains the following toxins:

- *Polychlorinated Biphenyls (PCBs)*
- *Chlorinated pesticides*—DDT, dieldrin, aldrin, endrin, chlordane, heptachlor, heptachlor epoxide, kepone, 2,4,5-T, 2,4-D
- *Chlorinated compounds* such as dioxins
- *Polynuclear aromatic hydrocarbons*
- *Heavy metals*—arsenic, cadmium, chromium, lead, mercury
- *Bacterial viruses, fungal and parasitic worms, fungi, and*
- *Miscellaneous*—asbestos, petroleum products, industrial solvents

In addition, a 1991 investigation by the US General Accounting Office found that the full extent of the radioactive contamination of sewage sludge island related by products nationwide is unknown. Most of the radioactive material is flushed down the drain by hospitals, businesses and decontamination laundries—a practice which has contaminated at least nine sewage plants in the past decade.

In 1977, EPA Administrator Douglas Costle estimated that by 1990 treatment plants would be generating 10 million tons of sludge per year, a thought that gives us all a massive environmental headache. Today there are about 15,000 publicly owned wastewater treatment works in the United States discharging approximately 20 billion gallons per day of treated wastewater into lakes, streams and waterways. Before treatment, this wastewater contains over a million pounds of hazardous components. Sewage plants use heat, chemicals and bacterial treatments to detoxify 42 percent of these components

through biodegradation. Another 25 percent escapes into the atmosphere and 19 percent is discharged into lakes and streams. The remaining 14 percent—approximately 28 million pounds per year—winds up in sewage sludge.¹

Once created, this sludge must be disposed of in some fashion. The available methods include incineration (which releases pollution into the air), dumping into landfills (which is expensive and often lets contaminants leach into groundwater), and ocean dumping (where it has created vast underwater dead seas). A fourth approach—gasification, using sludge to generate methanol or energy—is favored by EPA's Hugh Kaufman as the "most environmentally sound approach, but also the most expensive." A fifth approach—using sludge as plant fertilizer—was considered hazardous to health and environment until the 1970s, but it has the advantage of being inexpensive. As budget concerns mounted in the late 1970s, the EPA began to pressure sewage plants to adopt the cheapest method available—spreading sludge on farm fields.

A Rose By Any Other Name

Toed-eat the public at large about the benefits of sludge, the EPA turned to Nancy Flatt's employer, known today as the Water Environment Federation. Although its name evokes images of cascading mountain streams, the WEF is actually the sewage industry's main trade lobby and public relations organization, with over 41,000 members and a multi-million dollar budget that supports a 100-member staff. Founded in 1928 as the Federation of Sewage Works Associations, the organization in 1950 recognized the growing significance of industrial waste in sludge by changing its name to the Federation of Sewage and Industrial Wastes Associations. In 1960 it changed its name again to the cleaner-sounding Water Pollution Control Federation.²¹

In 1977, Federation director Robert Canham criticized the EPA's enthusiasm for land application of sludge, which he feared could introduce viruses to the food chain. The results can be disastrous, he warned. By the 1990s, however, Federation members were running out of other places to put the stuff. The Federation became an eager supporter of the farm bill, and even organized a contest among its members to come up with a more pleasing name for sludge.

The proposal to create a Name Change Task Force originated with Peter MacInnis, manager of Seattle's sludge program, after protesters noted that it cost less per ton to spread sludge on local tree farms

If I knocked on your door and said I've got this beneficial product called sludge what are you going to say? he asked. At Machno's suggestion the Federation newsletter published a request for alternative names. Members sent in over 250 suggestions including "il growth", "parentri", "biolite", "bioslurp", "brick go", "green me sea doo", "the end product", "humanure", "huelio", "organic residuals", "bioresidue", "urban biomass", "powergro", "organic recycliae", "nutri cake" and "ROSE", short for recovering of solids environmentally. In June of 1991 the Name Change Task Force finally settled on biosolids which it defined as the nutrient-rich organic byproduct of the nation's wastewater treatment process.

The new name attracted sarcastic comment from the *Dumbasspeak Quarterly ketten*, edited by Rutgers University professor William Lutz. Does it still stink? Lutz asked. He predicted that the new name "probably won't move into general usage. It's obviously coming from an engineering mentality. It does have one great virtue though. You think of biosolids and your mind goes blank."

According to Machno the name change was not intended to cover something up or hide something from the public. "We're trying to come up with a term... that can communicate to the people the value of this product that we spend an awful lot of money on turning into a product that we use in a beneficial way."

James Bynum, director of an organization called Help for Sewage Victims, saw a more sinister motive behind the name change. In 1992 the EPA modified its Part 503 technical standards which regulate sludge application on farmlands. The new regulations used the term "biosolids" for the first time and sludge which was previously designated as hazardous waste was reclassified as "Class A fertilizer". The beneficial sludge use policy simply changed the name from sludge to fertilizer and the regulation changed the character of sludge from polluted to clean so it could be recycled with a minimum of public resistance. Bynum wrote, "Sludge that was too concentrated to be placed in a strictly controlled sanitary landfill was promoted as a fertilizer and dumped on farmland without anyone having any responsibility." There is a real concern for everyone when a bureaucrat can write a regulation which circumvents the safety provisions of the major Congressional manmade environmental laws by simply changing the name of a regulated item.

A few months after the debut of biosolids, the Water Pollution Control Federation dropped the words "pollution control" from its own name and replaced them with "environment". At the group's

60th annual conference. WEF President Roger Dolin explained the reasoning behind the latest name change: "We don't control pollution anymore—we eliminate it. To the outside world, our people came to be seen as pollution people. In today's world, the word 'control' just isn't good enough." In fact, this claim was largely rhetorical. Virtual elimination has not been achieved for one single persistent toxic, said E. Davie Fulton, a Canadian official involved in ongoing efforts to clean up the Great Lakes.

So You See, It Is Good For You

In 1992, the Water Environment Federation—describing itself as a "not-for-profit technical and educational organization" whose mission is to preserve and enhance the global water environment—received a \$500,000 grant from the EPA to "educate the public about the beneficial uses" of sludge. The campaign will tie in with the Federation's ongoing efforts to promote use of the term biosolids, reported the Federation's December 1992 newsletter.

"Beneficial use" is the industry euphemism for the practice of spreading sludge on farm fields. Even before the current push, sludge has been applied to soil for decades. Milwaukee's sewage sludge has been dried and sold not only for 70 years as "Mlorgante," a lawn and garden fertilizer. Other cities have offered sludge products such as "Nu-Fertil" from Chicago, "Nitrichumus" from Los Angeles, and "Bio-actinic" from Houston. In the early 1980s, Mlorgante contained high levels of cadmium, a toxic heavy metal, and the fertilizer bag carried a warning: "Do not use on vegetable gardens, other edible crops or fruit trees. Eating food grown on soil containing Mlorgante may cause damage to health." Under current federal rules, however, most sludge products carry no such warning. Consumers are largely unaware that tens of thousands of acres from Midwest dairy land to Florida citrus groves and California fruit orchards are routinely fertilized with byproducts of industrial and human sewage. In theory, this approach harkens back to the time-honored primitive system of composting. Of course, the organic farmers of previous centuries didn't have to worry that their right soil contained a synergistic soup of dioxins, asbestos, DDT, and lead that could contaminate themselves, their groundwater, and their food.

I am appalled at what I would term the total disregard for human health and the fact that the Environmental Protection Agency is actively promoting and is, in fact, taking communities throughout the United States into existing programs for the composting of

sewage sludge," said Melvin Kramer, an infectious disease epidemiologist who has been researching the issue since the late 1970's. He says the EPA's plan for sludge disposal poses "a significant health hazard to the population in general, but especially to the elderly, children, and the infirm, both in terms of nuisances as exemplified by excessive pungent odors and minor allergic reactions . . . to life threatening diseases."²⁰

Some environmental activists with Greenpeace and the Citizens Clearinghouse on Hazardous Waste have warned about the dangers of sludge, but most groups have bought into the argument that sludge farming is the least offensive way to deal with the problem of waste disposal. Some groups even support sludge farming. During the 1970s, these environmentalists worked for passage of the Clean Water Act. Now they find themselves in the awkward position of defending its consequence—huge mountains of poisonous sludge that need to be put somewhere. Sarah Clark, formerly of the Environmental Defense Fund, claims that sludge farming is the best means of returning to the soil nutrients and organic matter that were originally removed. It is recycling a resource just as recycling newspapers or bottles is. If the right safeguards are taken, it can be environmentally protective and even beneficial.²¹

Unfortunately, the right safeguards are not being taken. Joseph Znoble, a risk management consultant with the Pennsylvania-based Waste Risk Education Fund, agrees that human waste residue can be applied to land in a safe manner. The problem, he says, is that it is often not done safely at this time. The primary reason that it is not always done safely at this time is a nearly complete subjugation of safety concerns by the USEPA in favor of their concern over solving their "disposal dilemma."²²

Dr. Stamford Everett, a chemist and expert on lead contamination, became alarmed about sludge on the basis of its lead content alone. The use of sewage sludge as a fertilizer poses a more significant lead threat to the land than did the use of leaded gasoline, he says. All sewage sludges contain elevated concentrations of lead due to the nature of the treatment process. Lead is a highly toxic and cumulative poison. Lead poisoning can cause severe mental retardation or death. It is now known that lead interferes with the blood-forming process, vitamin D metabolism, kidney function, and the neurological process. From the standpoint of lead alone, sludge is safe only if you are willing to accept a lowered IQ for the young children living in the sludge area. And what about the other toxins?

Tackett is appalled that the government would take the citizens' money and use it in such an odious way. The land spreading program for sewage sludge is a scam of enormous proportions driven mainly by money, he charges. "The high sounding justifications such as 'sludge is a beneficial resource' and 'sludge is just as safe as manure' are clever excuses designed to fool the public.... In truth, only one to three percent of the sludge is useful to plants. The other 97 to 99 percent is contaminated waste that should not be spread where people live.... Land spreading of sewage sludge is not a true disposal method, but rather serves only to transfer the pollutants in the sludge from the treatment plant to the soil air and ground water of the disposal site."¹²

One Hand Washes the Other

Tackett also condemns the "selective science" and manipulation of research money used to rationalize sludge farming. Millions of dollars have been made available through EPA and other federal, state and local agencies for beneficial use research. Toxicologists, public health scientists and medical researchers have not had a similar money pot available to study the potential dangers and adverse health effects of sewage sludge. It is no wonder then that the scientists selected by the EPA to serve on sludge advisory committees are the beneficial use researchers, and the only research reports they deem acceptable for the purpose of adopting new sludge spreading regulations are from the beneficial use studies.

The claims now made for sludge safety sound eerily like the earlier claims that DDT is perfectly safe and asbestos is a miracle fiber that poses no danger at all.

In fact, the researchers, advocates, regulators and practitioners of sludge farming are a closely interwoven group. Dr. Alan Rubin, for example, served as chief of the Environmental Protection Agency's sludge management branch when he oversaw the development of new regulations for land farming of sludge fertilizer. In 1989 the EPA joined Rubin to the Water Environment Federation while continuing to pay him at his salary. Now Rubin the regulator is a full-time cheerleader for biosolids. Together he and Nancy Blatman have barnstormed the nation, meeting the press, schmoozing with politicians, and debating critics.¹³

Dr. Terry Logan, a professor of soil chemistry at Ohio State University is another sludge advocate who has conflicting roles and interests. He co-chairs the US EPA Peer Review Committee, a group

described by the EPA as "the best scientific talent and data assembled" to help develop recent federal regulations that eased restrictions on sludge farming. Logan also receives \$2,400 per month as a paid consultant and board member of the N-Viro International Corporation, which has developed a patented process for converting sludge into fertilizer by mixing it with dust from concrete kilns and heat drying it to kill germs. N-Viro, a client of Hill & Knowlton PR handles sludge treatment and disposal for sewer plants in New Jersey, Minnesota, Ohio and Harsham, England. At the recommendation of Logan's committee, the EPA promulgated a modification of its Part 503 regulations that increased the allowable heavy metals in sludge fertilizer. At the same time that Logan was involved in developing the new relaxed regulations, he held stock options in N-Viro whose value could have dropped substantially if he had recommended stricter requirements.⁵⁶

Despite its many customers, N-Viro is in shaky financial condition. Since 1993, the value of its stock has plummeted from \$9.50 to \$1.50 a share.⁵⁷ One of its major problems has been the slow rate of acceptance of land farming of sludge. The company is banking on sludge regulator promoter Alan Rubin to help overcome political and PR obstacles so the company and industry can flourish. In 1994, Dr. Logan was named "man of the year" by the EPA and N-Viro, along with the Compost Council and the Rodale Institute received a \$500,000 grant from the US Congress to help promote its product.⁵⁸

Criticism of EPA's sludge policy has emerged from within the EPA itself. William Samour has spent 16 years supervising hazardous waste management programs. In 1990 he testified before the Georgia State Senate on the close working relationships formed with government officials who are lured by the huge profits made by the waste management industry. There are many examples. The power of this industry to influence government actions is further enhanced by the ease with which government regulatory officials are hired by the industry. Over thirty state and federal officials have gone over to the waste management industry in the southeast region alone including a former EPA Regional Administrator in Atlanta. This practice extends even to the highest levels of government. William Ruckelshaus, a former Administrator of EPA and a close advisor to President Bush is CEO of the second largest waste management company in America. He is credited with getting William Reilly, the present Administrator, his job. With this kind of influence and power trying to

have a meaningful hazardous waste reduction program . . . is frankly like trying to have a meaningful egg laying program after you've let the tox into the chicken coop."

Our Sludge Doesn't Stink

The EPA's PR strategy for sludge was first outlined in a 40-page report published in 1981 with a classic bureaucratic title: "Institutional Constraints and Public Acceptance Barriers to Utilization of Municipal Wastewater and Sludge for Land Reclamation and Biomass Production" (imagine the acronym ICPABU MWSLRBP). It warns that there is an irrational component to the public's attitude toward sludge including the widely held notion that sludge smells bad. It's difficult to say to what extent odors emanating from sludge may be imagined. However, it is the most common ground voiced by opponents in taking action against land application projects. In addition, the growing awareness about hazardous wastes and the inadequacy of their post-disposal practices will inevitably increase public skepticism.

While national environmental groups are usually no threat to sludge burning, ICPABU MWSLRBP warns that projects may be blocked by small local groups. Citizens who feel their interests threatened may often mount a significant campaign against a project. To counter this opposition, ICPABU MWSLRBP advises project advocates to choose a strategy of either aggressive or passive public relations. Aggressive public relations uses glossy brochures describing the project, open public meetings, presentations to specific interest groups, presentation of films about similar projects, local media coverage, technical education campaigns for the public and in schools, establishment of a hotline for quick response questions and presentation of material stressing community benefits from the project. This approach however entails some risk. A highly visible public relations campaign would itself create and foster opposition against the project. In some communities therefore ICPABU MWSLRBP recommends using a passive public relations campaign to introduce sludge burning. A passive campaign makes little effort to reach out to particular segments or constituents of the public. Rather, information about the project is disseminated to individuals and groups which made the effort to obtain it. This secretive approach works best in small rural communities where the application site is relatively isolated.

Kelly Surber, a PR specialist in sludge crisis management, offered her advice to other sludge marketers in a 1984 newsletter:

Campaign Tactics: How to Strategize for Successful Project Development. The article warns that "public opposition has taken its toll on the sludge industry, which is experiencing new, unprecedented levels of interest, discomfort and complaints from the public." To counter these stirrings of community self-determination, Sarber uses tactics that she attributes to sludge opponents such as "creating photo opportunities, using a small number of vocal people to make it appear like a majority, and undermining messages through counter-messages." Countering the opposition without letting them determine the approval process is the most important goal of a good campaign manager. This is called "controlling the debate."

To control the local media's coverage of the sludge issue, Sarber recommends "a pre-emptive strike" to "get positive messages out about the project before the counter-messages start." She advises sludge companies to identify and develop several advocates or opinion leaders who can persuade other community members that they have taken the time to learn about the project and are comfortable with it from an environmental standpoint. They should be used, however, to avoid seeking early public support from local politicians because "a local community can be very undergoing" if a political leader believed to have come to some type of conclusion about what is best for the rest of the community before anyone else has heard about the project. A better positioning of the politicians is to provide education "while promoting the importance of the community having an open mind about the project."

Sarber is especially proud of her PR work in 1991-1992 for Enviro-Gro Technologies, a sludge hauler now operating under the name Wreckerator. Sarber quietly approached business leaders and politicians in the rural town of Holly, Colorado (population 1,000) when Enviro-Gro had targeted it as a dumping-site for New York City sludge. When the proper groundwork had been laid, the pro-sludge campaign struck like a blitzkrieg, quickly deploying third party scientific advocates to assure local citizens of the safety of sludge. Sarber bragged about stealing the media spotlight at a public meeting organized by opponents of sludge burning. Pro-sludge advocates were seated directly on stage and demanded participation in the forum which was granted. In addition, local advocates promoted the project through "generating understanding activities in the audience." By targeting the press during the event, the spin of the story changed from an opposition meeting to one which showed that several citizens wanted to find out how they could get more biomass. Rather

than allowing the opposition to have a press success in blasting the project, the media stories show support, with only a few dissenters. When Governor Romer of Colorado came out to throw a shovel full of New York City biosolids on a field, it was apparent that the initial siting of the project had been successful.

Flush With Victory

Kelly Sober has fought on the front lines of several other sludge campaigns involving sludge disposal for New York City. In addition to Enviro-Gro, her employers have included the New York Organic Fertilizer Company and Metro Joint Venture, the major players in the Big Apple's bidon-doux sludge disposal game. The city has signed contracts totaling \$63 million with Metro and New York Organic, in exchange for which the two companies have committed to haul away over a thousand tons per day of city sewage sludge.¹⁰

New York has an especially messy history of waste disposal problems. In addition to sewage, the city used to dump its garbage into the ocean, and is famous for the 1987 "garbage barge" that was forced to sail for nearly 3,000 miles in search of a place to dump its cargo. New York's practice of dumping sludge into the ocean first came under fire from the EPA in 1981, prompting the city to file a lawsuit arguing that ocean dumping was environmentally preferable to land-based alternatives. In 1985, however, the EPA found that New York's ocean dumping site, located 12 miles offshore, had suffered heavy degradation, including bacterial contamination of shellfish, elevated levels of toxic metals, and accumulations of metals and toxic chemicals in fish. Federal legislation in 1987 forced New York to close the 12-mile site and begin dumping at a new site 100 miles from shore. Soon after, a fisherman near the 100-mile site began to complain of deer carcasses and diseased fish. In 1988, Congress passed the Ocean Dumping Reform Act requiring a complete end to ocean dumping by June 1991 and imposing fines of up to \$5 million per day if New York failed to comply.

As the city scrambled to meet the deadline, Metro and New York Organic used both aggressive and passive PR to persuade small towns in other states to take their sludge. Their efforts met with mixed success. About 10 residents sent off their attempts to export New York sludge to their pastures, and Metro's efforts in Oklahoma failed in four towns. In Illinois, Oklahoman (population 120) news of Metro's interest triggered what Illinois Mayor Bill Hines described as a civil war. Within two weeks after the paper went public, state

officials had received over 200 angry letters from Thomas residents.⁷ The public outcry prompted the Oklahoma legislature to vote unanimously for a moratorium signed into law by the governor on April 17, 1992 prohibiting land application of sludge that contains "significantly higher concentrations of heavy metal than sludge produced in the state."⁸

"It's a scary thing at first to take New York's waste and spread it on the land that supports you," Sarber admitted. In fact to some people it's the most scary thing they can think of. But after a little education most people eventually come around."⁹

In her work as an environmental media consultant, Sarber faced questions that went beyond issues of nitrogen content and pH balance. She was called upon repeatedly to deny allegations that her employers were engaged in environmental violations, influence peddling and organized crime.

Mero came under criticism, for example, when it was discovered that one of its partners, Standard Marine Services, belonged to the Frank family barge empire—a group of companies labeled by the state as New York Harbor's worst polluter. Standard Marine owed over \$1 million in taxes and judgments and was forced to drop out of Mero after it was unable to get financial bonding.¹⁰

In 1992, *Versus* reported that New York deputy mayor Norman Steisel, whose duties included oversight of the city's sludge program, was a partner in New York Organic Fertilizer Co., and noted that the brother of New York Senator Alfonse D'Amato was a partner in the law firm that negotiated New York Organic's contract with the city. A probe was launched to investigate possible influence peddling and company spokesperson Sarber promised that "we will cooperate fully."¹¹

A few months later, Alphonse D'Arco, a former boss for the Luchese crime family, testified during a June 1992 murder trial that two Mero partners—the John P. Picone and Peter Scalambra & Sons construction firms—had paid \$90,000 a year in payoffs to the Luchese family. In separate but corroborating testimony, D'Arco and Gambino family turncoat Salvatore C. The Bulli, Gravano also described Picone's involvement in a sweetheart deal involving bid rigging and manipulation of New York labor unions to benefit the Gambino, Genovese, Luchese, Colombo and Bonanno crime families. Picone and Scalambra were unavailable for comment but Sarber was brought out to state that her employers "have had no business or personal relationships with any of these people."

In 1991 *Newsdays* reported that Merco was using the Cross Harbor Railroad to ship its sludge, even though Salvatore Frane, at that or Cross Harbor investor had been banned for life from the waste industry in New Jersey. In response to a reporter's inquiry spokesperson Kelly Sather said Merco had no idea that Frane was involved with Cross Harbor.⁵⁴

Walk Softly and Carry a Big Slick

On December 13, 1991 *Newsdays* reported that stealth is New York City's new weapon in its war on sludge. The city has decided to make a secret of where it plans to ship tons of the sewage gunk beginning next month. It hopes to secure permits for sludge disposal in some towns before the word gets out so it can get cleaned up about it. Thus the names of towns where New York Organic Fertilizer has applied for sludge permits are strictly hush-hush. One town offices have been told. The city wants to avoid a political circus such as the one in Oklahoma where three towns rejected another New York plan for sludge because they feared it could carry everything from AIDS to organized crime with it.

Bowie, Arizona (population 400) was one of the communities targeted with passive public relations in 1992 when Bowie resident Ronald K. Bryce received state approval to apply 83 million pounds per year of New York sludge on his cotton fields. The rest of the community found out about the plan when someone overheard a conversation in a restaurant in the summer of 1993 shortly before the first deliveries of sludge were scheduled to begin. Bryce had received his permits without public hearings or even public notice. In *the Dallas Morning News* reporter Keith Begwell sought an explanation from Melony Burton, a solid waste officer with the Arizona Department of Environment Quality. Our approval was issued on guidelines which are excellent but without the public comment, Burton said. She noted that sewage sludge had been applied to crops in Arizona at least since 1978. But we still don't know. Burton said. Only guidelines. We have no authority to censor the legacy.

Exposure of the sludge presented a problem for the state health secretary. Her information - public meetings but no explanations - failed to play well. Who knows what will happen in 20 years we don't want another Love Canal, said Robert Wood, a vice president of the Bowie Chamber of Commerce.

Further inquiry by Begwell discovered that over 100 million pounds of sludge from Arizona's own Maricopa County sewers had also

been spread on area farms since 1983. EPA regulations had enforced limits for only one metal and one chemical in the sludge— even though Pima County sewage treatment superintendent Donald Armstrong admitted that the county sewer system received wastes from about 1,800 industries, roughly half of which use toxic chemicals. Test data showed that the Pima County sludge contained over 80 priority pollutants—including dioxin, phenol and toluene—along with high levels of cadmium, lead and other toxic heavy metals.

Actually the Arizona sludge was relatively clean compared to the stuff being shipped in from New York. Sludge from San Diego, Los Angeles or New York you have to look at carefully—it's different in largely industrialized areas,” said Ian Pepper, a soil and water science professor involved in studying Pima County's sludge use program. “The metal content of Tucson sludge is relatively low,” Pepper said. There isn't as much impact from heavy industry.

“I've been eyeball deep in sewer sludge disposal on agricultural land for years,” said Kirk Brown, a soil science professor at Texas A&M University. “Some sludge you could use for 50 years before having problems—not New York City's.” Brown's assessment was confirmed by Ian Michaels, a spokesman for the New York City Department of Environmental Protection, who estimated that the city had 2,000 unregulated companies discharging industrial waste into the sewers but admitted that his department had no way of knowing how many—or there are. Michaels said half of New York's 44 sewage treatment plants were built in the 1950s, and only 11 meet modern treatment standards.*

Despite this information, Ronald Bryce began spreading New York sludge on his farm in Bowie on April 5, 1994. Town residents complained that the state allowed him to spread millions of pounds of sludge before receiving any test results on the incoming material. Tests on the April shipment were finally completed in July, showing that the New York sludge contained petroleum hydrocarbons at 16 to 22 times the level at which state regulations require cleanup from oil and gasoline spills. The tests also showed fecal coliform bacteria at 535 times the limit, twice under federal law.

That sounds more like untreated sludge—soil that would never appear in the EPA's San Francisco office. It can't be used, applied—it won't have to go to an approved treated or treated sludge facility—or to a treatment plant. Those are binding rules. Nevertheless, Bryce was allowed to resume spreading on his farmland in August 1994.

When Push Comes to Sludge

After Merco's rejection in Oklahoma, it turned to an alternate site—the Mexican border town of Sierra Blanca (population 500), one of the poorest towns in one of the poorest counties in Texas. Once again, citizens quickly mobilized to protest Merco's plans to spread sludge on desert grazing land nine miles from a planned repository for nuclear waste from power plants in Maine and Vermont.

To pacify the town, Merco offered money to buy a new fire engine, donated \$16,000 to the school board, set up a scholarship fund, threw barbecues, handed out Christmas turkeys, and promised \$50,000 a year to the local community development corporation. Merco executives also contributed \$5,000 to Texas Governor Ann Richards, whose appointees on the water commission approved Merco's permit in record time.⁷⁸

These host community benefits are considered normal in these types of projects, explained Merco representative Kelly Barber.

Critics however noted that the money Merco was spending in Austin and Sierra Blanca was a drop in the bucket compared to the \$108 million the company was receiving from New York City.

Local supporters of the plan included George Fore, ranch manager of the Merco site and President of the Texas Beneficial Use Coalition—a Merco front group. Fore accused opponents of being irrational: "It's like that [salts] since commercial. When the cowboys find out the stuff they have is from New York City, they want to strangle someone up. It's the same way with land application. People get pretty darn bothered when they find out you're bringing sludge out here from the big city."⁷⁹

Critics however expressed more visceral objections. I've smelled cow manure—the raw padodes in Vietnam they use human manure to fertilize. That's a different smell—said Sierra Blanca resident Leonard Flores. This is like a chemical smell.

In February 1994, several opponents of the sludge farm said they had received money from both the town's Bill Addington, leader of an anti-sludge citizens group called Save Sierra Blanca, blamed Merco of a recent fire in which his family's lumber company had burned to the ground, a claim that Merco attorney Jon Masters described as absolutely ludicrous.⁸⁰

In August 1994, EPA tests of Merco's sludge in Sierra Blanca showed 355 times the safe level of fecal coliform bacteria. We don't perceive it as a problem, responded Masters. The fecal coliform testing is erratic in its results.⁸¹

"The Smell of Money"

The town's smudge war hit the national airwaves in 1994 when it was featured on *TV Nation*, a satire show hosted by investigative filmmaker Michael Moore. *TV Nation* accompanied a truckload of New York sludge coke truck and moist like most timer cakes from New York to Sierra Blanca where Metro's representative Kelly Saber gave a tour of the farm site. There's been a lot of thought and there's a lot of integrity in how we're doing this and the product is in no way... Saber stopped. Asked about the smell, another Metro employee said, "It's the smell of money," she said.

The cheap humor turned serious as the comment got to the Washington office of Hugh Kudinian. This hazardous material is not allowed to be disposed of or used for beneficial use in the state of New York and it's not allowed to be disposed of or used for beneficial use in Texas either, Kudinian said. What you have is an illegal industrial operation trespassing on an environmental benefit project and it's very irresponsible. He fears other New York are being protected, the citizens and law of New York are being protected and the people of Texas are being poisoned. **Something is rotten in Texas.**

TV Nation cited more complaints from oil residents in New York to the dusty streets of Sierra Blanca. You can smell it over 100 miles away. New York has my right to dump their stuff as one woman said angrily. Another said, "We've gotten a lot of allergies. People who have never had allergies in their lives have come up with a bunch of stuff like that."

Soon after the law and Metro filed a lawsuit seeking \$33 million damages from Kudinian and *TV Nation's* producer, Sam Ederman Features Inc., accusing them of defamation and perjury statements made with actual malice. The recklessness could not be denied. The lawsuit complaint that Metro held out that \$300,000 in benefits to independent contractors at a plant in Texas but it which had been lost as a result of the press. If Hugh Kudinian countersue for \$3 million, leaving Metro \$1.5 million in the void among Texas and New York laws and forcing will close the suit.

In the past, Kudinian has blown the whistle on toxic contamination at Love Canal and Times Beach Missouri. In private Kudinian has tried to talk an EPA Administrator, Alan Butts, into a whitewash after being forced to admit to Congress that the evidence he had for his claim was lacking.

Lavelle served four months in jail for lying to Congress about diverting superfund money for political purposes.

This issue is much bigger, Kaufman said, "because it is obstructing a criminal investigation of companies affiliated with organized crime involved in the illegal disposal of waste with an illegal contract at great taxpayer expense. The Barford Lavelle thing was just using superfund for political shenanigans—determining which site would be cleaned up or not cleaned up based on politics."

In Sierra Blanca, Kaufman said, "We're talking about government basically taking a dive for organized crime during an open criminal investigation."

Victimless Crime?

Chemicals, pesticides, acids, heavy metals, radioactivity—to some extent these risks can be quantified. However, assessing the health threat from the human disease pathogens inhabiting sewage sludge defies the capabilities of current science. This is especially true given the ability of mutating microbes to withstand antibiotics and growing concerns over newly emerging diseases such as cholera virus and cow disease killer e. coli and hanta virus.

In 1983 a team of researchers at the University of Arizona published an article titled "Hazards from Pathogenic Microorganisms in Land Disposed Sewage Sludge." Their study found that significant numbers of dangerous human disease organisms infect *even treated sewage sludge*. Thus no assessment of the risks associated with the land application of sewage sludge can ever be considered to be complete when dealing with microorganisms.

The viruses, bacteria, protozoa, fungi and intestinal worms present in sewage sludge is mind boggling. Many of the pathogens cause diseases that sicken, cripple and kill humans including salmonella, shigella, campylobacter, e. coli, enteroviruses (which cause paroxysm meningitis, fever, respiratory illness, diarrhea, encephalitis), giardia, cryptosporidium, roundworm, hookworm and tapeworm. Sludge pathogens can move through many environmental pathways—direct contact with sludge, evaporation and infiltration contaminated groundwater, contamination of rodents burrowing in sludge and uptake through the roots of crops.

Already victims have begun to emerge. In Islip, New York, 25 year old Harry Dolin ran a coffee truck at a Long Island Railroad station 1,000 feet away from a sludge composting site. In May 1984 he began suffering health problems. Doctors treated him for asthma,

arthritis, Wegener's disease, Lyme disease, kidney disorder and bronchitis. Finally in January 1992 when he could no longer breathe they performed a lung biopsy and discovered *Aspergillus fumigatus*, a common byproduct of sludge composting. By the time the disease was diagnosed it was unstoppable, spreading to his spine, his legs and finally his heart, leading to his death on September 23, 1992. Other residents of Isip complained of chronic coughing, nosebleeds and other reactions. A study by the state Department of Health found that near households downwind of the composting plant had four times the average background level of *Aspergillus*. State officials concluded that the study did not find that the higher concentration of mold spores increased health problems. "But such a connection might in fact be present...further study was needed to come to a definitive conclusion."

Outside Sparta, Missouri, a tiny rural town whose sewage plant began operations in the late 1980s, dairy farmer Ed Roler began having problems with his cows in 1990. They were falling sick and dying and no veterinarian or university scientists could tell him why. The death and disease continued until late 1993 when the farm declared bankruptcy. Someone suggested to Roler that his cows could be victims of sludge which was dumped on a nearby field in 1989, 1991 and suggested he read journalist Ed Hagg's articles in the topic which had recently appeared in two farm magazines.

Eventually Roler initiated scientific soil tests. "We found lots of heavy metal contaminants. The field where the sludge was dumped ran into our fields. They tested a dead cow and found lead, cadmium, thorioc in the liver, kidneys, bones, inc teeth." Roler hired an attorney. His situation is especially difficult because the landowner who accepted the sludge is a public official in Sparta and sits on the board of Roler's bank. As of 1995 the Roler case was still pending and Ed's father was experiencing health problems suspected to result from his exposure to sludge.

"I can't believe what's happening," Roler said. "There are very few places to turn...I don't know if the government can ever fix this up."

In Eastern Washington dairy farmers Linda and Raymon Zinder began to see cows die or fall ill after sludge was spread on their grazing land. We noticed more illness and other malfunctions used to afflict Zinder. Tests found heavy metals in soils at the sludge disposal site and in water from two neighborhood wells that serve several families. Since then Raymon Zinder has been diagnosed with

nickel, poisoning and seven family members show signs of neurological damage which they believe is linked to heavy metal poisoning including zinc, copper, cadmium and manganese. Sixteen neighboring families have experienced health problems ranging from flu symptoms to cancer. Linda Zander formed an organization called "Help for Sewage Victims" and began to hear similar stories of sickness and death from farmers near sludge sites in Virginia, Pennsylvania, North Carolina, Georgia and other parts of the country.

Sludge is often marketed to farmers as free fertilizer—but environmental consultant Susan Cook, who tested the Zanders' water supply, warned that farmers may be happy initially but the problems don't show up overnight. It was nearly two years before Ray and Linda realized what was happening.

In fact, says toxicology professor Karl Schurr of the University of Minnesota, some of the same chemicals found in sewage sludge were also employed by Cesare Borgogno and his sister Lucrezia Borgogno in Italy during the 1900s to very slowly poison their opponents.

Let Them Eat Cake

As horror stories like these have begun to leak out, advocates of sludge-farming are responding. There is no doubt among sludge scientists in general that their long and arduous efforts to convince society of the safety of sludge have been set back a few years. Dick Gossden in an *BioCycle* magazine article good effect—“is that it stoked the masses” to get funds to mount education programs. Gossden—a coveted funding award show-stopping scientist—advocates like Tony Legan and Lester Shadel supporting cast of waste-water treatment plant operators. Put another way, this is corporate executive advertising agency. If the nuclear industry can convince the public that nuclear energy means clarity, then improving the image of sludge would be “piece of cake.”

As we go to press, the *Biosolids PR Hit* is picking up steam. The Water Environment Federation met in July 1995 to examine the public debate on biosolids recycling in all parts of North America.

On the local media front—“share special strategies, tactics and materials developed for targeting specific audiences and maximize their region's successes,” *Sludge* newsletter reported that Charlotte Newton of Lowell Lake PR whose firm has received EPA's first public sludge-farming advocacy grant, “get my team with opponents. Attack them on a way that does not denigrate them. You can't play to those at a jetty level,” she recommended.

One measure of the success of the WEF's Biosolids Public Acceptance Campaign is that major food companies and associations are reversing their long standing opposition to sewage sludge. Until recently for instance the National Food Processors Association—the main lobby group representing the food industry with members such as Del Monte, Heinz and Nestle—strongly opposed accepting the sewage sludge grown fruits and vegetables. In the wake of the hobby from WEF and EPA that opposition is waning.

In 1992 for tomato and ketchup crop Heinz responded to critics' misgivings about sludge by writing: "Heinz Company feels the risk of taking municipal sludge—which is known to be high in heavy metals such as cadmium and lead—is not a health risk which we need to take. Root crops such as potatoes, carrots and other vegetables which are grown under the ground can take up and accept the first few millimeters of heavy metals." It should be noted that once the lead levels are present in the soil they stay there for an indefinite period of time. We have at times dropped suppliers who used the municipal sludge on their crop and

In 1995 however a Heinz representative said they were reconsidering their policy. Other companies in the following set (Cris Meyers, Clark) representative for the huge Del Monte company explained that his company's long standing position "to avoid using raw agricultural products grown on soils treated with municipal sludge" was likely to change. The EPA has asked the National Academy of Sciences (NAS) to conduct an extensive study of the outstanding safety issue. Del Monte is an active supporter of this study which we hope will facilitate sewage use in the future. *

Once this has been accepted as a crop fertilizer the powerful National Food Processors Association lobby will strongly support growing food grown on sludge land. According to NFA representative Clark James consumers don't need to know whether the food has been grown in sludge.

Currently—~~at least~~ organic farmers are prohibited from using sewage sludge on their crops but the sludge industry is pushing for a repeal by the following organizations and this will be a battle that I fear may try FR in the future. The amount of farm sewage sludge used for growing is currently very small. However said I am forced to tell a Certified Organic Farmer, "in a gene what is it law?" The law the sewage sludge promoters is to say that sewage is so clean it can even be certified organic—what a way to greenwash sewage sludge!**

SILENCING SPRING

The big corporations our clients...in service of the environmental movement....The corporations are wrong about that I think the companies will have to give in on many important issues. Because the companies are too strong they're the establishment. The environmentalists are going to have to be like the mullahs in the square in Rumania before they prevail.

FRANK MANKIEWICZ

Vice-Chairman, Hill & Knowlton PR

More than any other modern American author Rachel Carson is credited with giving birth to populist ecological awareness. *Silent Spring*, her bombshell 1962 best-seller, gave a dramatic prophetic and factual account of massive agrochemical poisoning from the chemical industry's sales (3500 million a year in 1962) of DDT, mirene, heptachlor and other dangerous toxins. Written with the goal of shocking the public government and industry into action, it sowed seeds of consciousness that burst forth eight years later when some twenty million Americans interrupted their business as usual to participate in the first Earth Day, April 22, 1970—a day of protests, marches, rallies, concerts and teach-ins on the environmental causes wrought by industrialism. After years of public outcry DDT and other chemicals that Carson warned about were banned or restricted from use within the United States.

Silent Spring also created a crisis in PR crisis for the powerful agricultural chemical industry which had emerged after World War II based in large part on the industry's widespread use of DDT and its development of 2,4-D and 2,4,5-T herbicides. The agrochemical industry hit back at Carson with the PR equivalent of a prolonged carpet

bombing campaign. Even before her book was published, Avison, a chemical company technician, successfully intimidated its publisher into changing it or canceling publication. The National Agriculture Chemical Association doubled its PR budget and distributed thousands of book reviews trashing *Silent Spring*. Monsanto chemical company published *The Desolate Year*, a parody in which failure to use pesticides causes a plague of insects that devastate America. About 8,000 copies were sent out to book reviewers, science and gardening writers, magazine editors and farm journalists. The argument was picked up by Walter Sullivan of the *New York Times* who wrote: "By stating her case so one-sidedly, Rachel Carson forfeits persuasiveness."

She also lays herself open to parody. Some unsung hero of the chemical industry has written for Monsanto magazine an article entitled, *The Desolate Year*²³

A rising young PR executive named F. Bruce Harrison was appointed manager of environmental information for the manufacturers of agricultural pesticides. He was assigned to coordinate and conduct the industry's attack on the book. In their campaign to discredit Carson, Harrison and his cohorts used crisis management including emotional appeals, scientific misinformation, front groups, extensive mailings to the media and opinion leaders, and the recruitment of doctors and scientists as "objective" third party defenders of agrochemicals.

Today agrochemical poisoning of our soil, wind, water, food and bodies is a worldwide environmental health threat. Supermarket surveys find that most foods in the US are routinely contaminated with one or more pesticide residues and in Third World countries the use of dangerous chemicals is even more widespread. The US ban on DDT hasn't stopped it from being manufactured and used elsewhere and global use is now at an all time high. Everyone on the planet has scores of pesticides and other chemical contaminants stored in body fat and organs - a toxic biological cocktail whose full consequences are as yet unknown. Evidence is emerging that DDT and other organochlorine pesticides induce hermaphrodites, triggering sexual and physiological abnormalities in humans and animals.

Rachel Carson succumbed to cancer on April 14, 1964 never seeing herself venerated as the founder of modern environmentalism. However, her old nemesis, Bruce Harrison is alive and thriving. He even has his own book out, a PR how-to guide titled *Going Green: How to Communicate Your Company's Environmental Commitment*²⁴.

Going, Going Greenwash

In 1973 Harrison established his own PR company drawing in clients such as Monsanto and Dow Chemical who were among the sponsors of the campaign against *Silent Spring*. In 1990 he declared "green PR" to be the sole specialty of his firm and in 1994 The PR trade publication *Inside PR* named him a "PR All Star". His award stated that by writing *Going Green* Harrison had "confirmed his status as the leading [PR] thinker on environmental issues" and as a continuing "pioneer in the field."⁶

The E. Bruce Harrison Company now has offices in DC, Dallas, Austin, New York, and San Francisco and recently opened a new office in Brussels, Belgium that will, in the words of *Inside PR*, help its transnational clients work through the complexity of Europe's new environmental regulations. The company employs more than 50 staff and nets \$6.5 million dollars annually working for about 80 of the world's largest corporations and associations including Coors, Clorox, R.J. Reynolds, the American Medical Association and Vista Chemical. Harrison's clients include corporate front groups like the Global Climate Coalition (which opposes environmental action to prevent global warming) and the Coalition for Vehicle Choice (which opposes emission control regulations for automobile manufacturers). He has even received taxpayer funding from one of his clients, the federal Environmental Protection Agency (EPA).⁷

In the perverse world of corporate public relations, propagandizing and lobbying *against* environmental protection is called "environmental" or "green" PR. "Greenwashing" is a more accurate pejorative now commonly used to describe the ways that polluters employ deceptive PR to falsely paint themselves an environmentally responsible public image while covering up their abuses of the biosphere and public health. In the years since the publication of *Silent Spring*, corporate public relations experts have learned how to tame and turn aside the activism that it spawned. Today a virulent pro-industry anti-environmentalism is on the rise, propelled by some of the same industries and PR practitioners who battled Rachel Carson. PR experts at Barson Marsteller Ketchum Strandwick, Bruce Harrison and other firms—*are waging and winning a war against environmentalists on behalf of corporate clients in the chemical, energy, food, automobile, forestry and mining industries.*

US businesses spend an estimated \$1 billion a year on the services of anti-environmental PR professionals and on "greenwashing" their corporate image. O'Dwyer's PR Service termed the environmental

struggle—the ate-and-death PR battle of the 1990s—it is a battle that is being waged on many fronts: television, the printed press, grade school classrooms, community meeting halls, the boards of directors of mainstream environmental groups, journalism conferences, and talk radio.

The PR industry's strategy for pacifying the environmental movement reflects its well-researched understanding of public opinion in the United States. Polls indicate that the vast majority of people today believe that human actions are damaging the natural environment they live in. Market researchers say that somewhere between 75 percent to 95 percent of US citizens consider themselves to be "green." More than 20 million Americans translate these concerns into contributions of time and money to environmental organizations.

Public opinion contrasts strongly with that of corporate executives. According to a survey by E. Bruce Harrison, 99.97 percent of business executives agree with the statement: "Overall, the quality of the environment in your country is improving." Obviously business leaders are a minority whose opinions run contrary to the mainstream of American thought, but they are able to determine government policy thanks to a carefully planned long-term strategy. Harrison says top management realizes that the vast majority of green Americans are disconnected from environmental reality, but communications specialists can now quantify the sources of this perception that need to be addressed.¹

Good Cop/Bad Cop

Environmental PR seeks to fix these misperceptions by convincing the public that ecological crises don't exist, that corporations are really protecting and improving the natural environment, and that environmental activists who criticize and attack industry are eco-terrorists, fear mongers, and the latest incarnation of the communist menace. Over the past decades anti-environmental PR practitioners have refined a combination of "good cop/bad cop" tactics—a two-pronged strategy that skillfully creates and exploits divisions within the environmental movement. This strategy of divide and conquer—co-opts and compromises mainstream environmental organizations while simultaneously orchestrating extremist attacks against grassroots activists and others not willing to behave respectfully—in exchange for industry cash.

On the one hand the "good cop" strategy seeks to create partnerships between businesses and environmental groups for mutual

image building and financial profit. On the other hand—bad cop tactics include smear campaigns, lawsuits, and the creation of astroturf pro-industry groups that foment hatred and physical harassment of green activists.

The anti-environmental campaign is most obvious in the fringe activities of radical right-wing organizations calling themselves the "Wise Use" movement. Supported by corporate sponsors, Wise Use is loudly agitating against laws and regulations that constrain the rampant exploitation of natural resources. The Wise Use movement and its allies have few scruples about using slanders and misleading information to discredit environmentalists. According to Rush Limbaugh:

Environmentalists fall into two categories: socialists and environmental lunatics.... To discredit environmentalists Hall & Knowlton PR distributed a phony memo on Earth First! letterhead, calling for acts of violence to back up the mega machine.... Kathleen Marquardt of Putting People First was awarded "best newcomer" at the 1992 Wise Use Leadership Conference. Upon accepting her award, Marquardt said, "Here is our enemy—the Sierra Club, the Nature Conservancy, the Humane Society.... According to Marquardt, the Humane Society is a "radical animal rights cult—a front for a neo-pagan cult that is attacking science, health and reason."

Industry's "good cop/bad cop" strategy explains why many of the same companies that are funding anti-environmental extremists are also pouring money into mainstream environmental groups. See Lyford. It reports in *Propaganda Review* that corporate sponsors of the World Wildlife Fund, Nature Conservancy, Defenders of Wildlife, Natural Resources Defense Council, Environmental Defense Fund, Audubon Society and National Wildlife Federation also funded about one quarter of the 37 organizations described in the *Greenpeace Guide to Anti-Environmental Organizations*. Frank Boern, former president of the Nature Conservancy and a board member of AKCO Petroleum, advocates corporate cooptation of mainstream environmental organizations. As he told his colleagues, "One good thing about that is that while we're working with them, they don't have time to sue us."¹⁶

Company collaborations with environmental groups provide another benefit to corporate PR professionals: the opportunity to glean valuable knowledge from green critics of the companies they represent. "Companies must have some vehicle for knowing what the intelligent public thinks about their products and processes," says Joanna Underwood, president of the New York-based INFORM an-

environmental research organization. If they want to understand sophisticated outside views of environmental issues affecting their companies they would do well to have someone in the room.

Green Backers

In *Going Green*, Bruce Harrison declares that environmental activism is dead and that its death presents an opportunity to redefine environmentalism in pro-business ways. The activist movement that began in the early 1960s, roughly when the use of pesticides was attacked in the book *Silent Spring*, succumbed to success over a period roughly covering the last 15 years.¹⁸

As defined by Harrison, "success" boils down to money and access to power in the nation's capitol. After the first Earth Day in 1970, Harrison points out, ecological activism transformed itself from a popular grassroots movement into competing, professionally run non-profit enterprises, a multi-million dollar environmental bureaucracy, maintaining expensive offices in downtown Washington and divorced from its activist roots and any meaningful grassroots accountability. The executive directors of the big green organizations demand six-figure salaries. The mainstream environmental organizations are tightly run by boards which more and more include representatives from Fortune 500 companies, including PR firms. These green groups have turned their back on their local supporters who are little more than recipients of cleverly worded financial funding appeals.

Going Green says that despite their formal nonprofit status, today's big environmental groups are first and foremost business ventures. Harrison advises his PR clients that the green groups primarily want to stay in the greening business—and that their real goal is not to green but to ensure the wherewithal that enable it to green. The members of the big green groups are primarily concerned with raising money from individuals, foundations and increasingly from corporations. To do so they have chosen to maintain a respectable public image and are very willing to sit down with industry PR executives to cut deals. This puts the mainstream environmental groups right where industry wants them—in a position to be compromised through industry partnerships and funding.

Some of the biggest and best-known green organizations—the Brook Weston League, the National Wildlife Federation and the National Audubon Society among them—are receiving significant recognition and large cash contributions from corporate partners.

In exchange, the corporate benefactors have been able to buy a green image that is worth literally millions in the consumer marketplace. Harrison's PR firm spends much of its time helping its Fortune 500 clientele to build issue coalitions, partnerships and alliances with carefully chosen pro-business environmentalists.

Package Deals

As an example of an ideal partnership, F. Bruce Harrison points to the marriage between McDonald's restaurants and the Environmental Defense Fund (EDF). After the Citizens Clearinghouse on Hazardous Waste organized a national grassroots campaign against McDonald's use of plastic foam containers, EDF Executive Director Fred Krupp barged in, negotiated a highly publicized settlement, and began an ongoing "partnership" with the fast-food behemoth. Krupp gained a "victory" which the EDF highlights prominently in its fundraising activities. Bragging about this achievement helped EDF raise over \$17 million dollars in 1993, and pay Fred Krupp his salary and benefit package worth more than \$200,000 a year.

Harrison provides a bottom-line assessment of the deal. In the late 1980s, the company slipped into its worst sales slump ever—and the anti-McDonald's drive of the grassroots green activists was at least partly blamed. Krupp saw the golden arches of McDonald's, the nation's fast-food marketing king, as a sign of opportunity.

Krupp was ready to deal, and so was McDonald's.

EDF's mission, Krupp said, is not to attack corporations but "to get environmental results." He told the *New York Times*, "Being willing to consider new ways to regulate and being willing to talk with business in a businesslike way is not the same as being in favor of halfway compromises."²¹

The main beneficiary of the agreement, however, has been McDonald's, which saw its environmental reputation soar. Opinion polls now give McDonald's one of the highest environmental ratings of any US corporation. To celebrate the 25th anniversary of Earth Day in 1995, McDonald's announced that the fast-food giant would be printing recycling messages on millions of its bags and cups. EDF assists McDonald's in lulling the public into believing that something significant has occurred.

Meanwhile, McDonald's remains a massive corporate polluter. It continues to fire and underpay an unorganized workforce that serves greasy, fatty food grown with pesticides on factory farms, sold by an international franchise that destroys community economic diversity.

advertised with billions of dollars that target children using bigger than life millionaire sports celebrities. When a tiny group of London environmental activists had the audacity to leaflet McDonald's and publicly criticize its destructive policies, the fast food giant sued them under Britain's reactionary libel laws to prevent even this small mention of the truth from undermining the company's cultivated image.¹

In *Lossing Ground*, author Mark Dewie cites the EDF-McDonald's arrangement as an example of "high level capitulations" which unfortunately allow companies like McDonald's to look a lot greener than they are. The corporate exploitation of so-called win-win compromises has been relentless. Companies compete through paid and free media to out-green one another. That, of course, is all on the corporate food chain; it's predictable and understandable. But the environmentalists' complicity and their own PR-driven tendency to turn compromise into false triumph illuminates the desperation and impending moral crisis of the mainstream organizations.

At the grassroots level, meanwhile, thousands of citizens are engaged in genuine environmental activism, fighting off in their communities against the waste dumpers, wanton developers and pesticide pushers. These grassroots activists are being left largely dry by the big green groups which soak up almost all the environmental money from green philanthropists and small donors alike, while providing little or no support to the legitimate footsoldiers of the environmental movement.

Big green operations like EDF committed the best way to be effective is to look for common ground with businesses and eschew the politics of citizen empowerment and confrontation. According to Harrison, however, the aggressive tactics of grassroots activists are the greens' strongest weapons. Harrison writes that "Greening and the policy policy impact of greenism are being propeled by what I refer to as the AMP Syndrome – a synergy of Activists + Media + Politicians." Activists stir up conflict, naming victims (carrying people or public sectors) and villains (very often business interests). The news media respond to conflict and publicize it. Politicians respond to media and issues, moving to protect victims and punish villains with legislative and regulatory actions.

The Good Guy's Gouse

There has recently been a spurt of corporate advertising about how corporations work to clean the environment, writes Terry Mander, author of *In the Absence of the Scientist*. In fact, it is clear that

thumb that corporations will tend to advertise the very qualities they do not have in order to allay a negative public perception. When corporations say we care, it is almost always in response to the widespread perception that they do *not* care.¹

Some of the industrial polluters with the worst records have devised "public education" campaigns that enable them to placate the public while they continue polluting. The agrochemical conglomerate Monsanto, for example, has given away hundreds of gallons of its RoundupTM herbicide through Spontaneous Weed Attack Teams (SWAT) for spraying in inner city neighborhoods to make them "cleaner and safer places to live." Monsanto's PR also touts RoundupTM as a boon to endangered species, pointing out that the herbicide is used in Kenya, Africa to keep grasses from short circuiting electric fences that protect the endangered black rhino.

Dow Chemical's environmental PR campaign began in 1984 with the goal of making Dow a more highly regarded company among the people who can influence its future. Dow's reputation was still suffering from its manufacture of napalm bombs and Agent Orange defoliants that devastated much of Vietnam. The company mailed glossy "Public Interest Reports" to 600,000 opinion makers, scientists, the media, legislators, regulators, employers, customers and academics. Illustrated with numerous high quality photographs, the Public Interest Reports touted Dow's programs in the area of environment and five other "good works" categories.²

In 1986 a poll by the *Washington Journalism Review* found that business editors rated Dow's PR efforts tops among Fortune 500 chemical companies. As a member of the Chemical Manufacturers Association, Dow participates in Responsible Care, a PR program where each chemical company evaluates its own environmental performance. Its advertising slogan reinforces the message: "Dow helps you do great things." As a result of this system the company *Interim Demographic* listed Dow in 1993 as one of the 10 US firms with the best environmental reputations among consumers.

Many people use Dow as an example of doing the right thing. There is hardly a discussion of pollution control and prevention among American industries that fails to highlight Dow and the strides it has made," writes Lynn Laddman in the *Bay City Times* of Saginaw, MI. Laddman notes that Dow purifies effluvia even though the company "is still a leading polluter in the state and the nation."

Fish caught downstream from Midland, Dow's home base in Michigan remain median, according to state fish advisory

Sometimes a change of name is all it takes to improve a company's image. Waste Management, the nation's largest waste disposal company has paid an estimated \$15 million since 1980 for admitted and alleged violations of environmental laws. Recently the company changed its name to WMX Inc., and began advertising itself as a provider of "environmental services."

In addition to coopting environmental moderates, corporate PR firms are helping companies set up "community advisory panels" (CAPs) to strengthen their image in neighborhoods that host industrial facilities. Dow Chemical is one of the companies that has pioneered the establishment of CAPs. "I would give it three years and you'll see [CAPs] all around. They will be an integral part of doing business in all major industries," said A.J. Grant, president of Environmental Communication Associates in Boulder, Colorado. "You've got to have a marketing department; you've got to have accounting, and you'll have to have community interaction in the form of a CAP."

According to Joel Makower, editor of *The Green Business Letter*, CAPs differ in makeup, style, and function, but a typical CAP consists of 12 to 15 people—including activists, homeowners, community leaders—a representative sampling of just plain folks—as well as company representatives. CAPs create a forum for dialogue between the company and the community, but the nature of the dialogue is carefully modulated to emphasize emotions and image shaping rather than issues of substance.

As an example of their PR effectiveness, Makower relates the following anecdote. Members of one CAP, unbeknownst to the company, appeared voluntarily before a local hearing to testify why the company should be allowed to site an incinerator in their backyard. You can't buy that kind of help at any price.

Shifting the Blame

If corporations are not despoiling our natural environment, then who is to blame? According to corporate sponsored PR campaigns, the answer is obvious: *You are.* In place of systemic analysis and systemic solutions to social problems, they offer an individualistic and deeply hypocritical analysis in which "all of us" are to blame for our collective irresponsibility. If we would all just pick up after ourselves, they nag, the problems would go away.

Gregg Easterbrook, the author of *A Moment on the Earth*, concludes that the acts of individuals are the root of many environmental problems. He wrote in the *New York Times* magazine: "Though

environmental orthodoxy holds that Third World deforestation is caused by rapacious clear-cutters and ruthless cattle barons, penniless peasants seeking fuel wood may be the greatest threat to our forests.¹⁴ He conveniently fails to mention that penniless peasants are forced to colonize rainforests and cut down trees for firewood after being driven from their traditional lands by rapacious clear-cutters and ruthless cattle barons.

In the US the Keep America Beautiful campaign (KAB) is industry's most organized proponent of the belief that individual irresponsibility is at the root of pollution. About 200 companies including McDonald's fund KAB to the tune of \$2 million a year. According to the *Greenpeace Guide to Anti-Environmental Organizations*, most of the companies that support KAB manufacture and distribute aluminum cans, paper products, glass bottles and plastics that account for about a third of the material in US landfills. KAB's message to consumers is that *they* are responsible for this trash and that they must solve this problem by changing their habits.¹⁵

Since the early 1970s Greenpeace reports, KAB has used more than half a billion dollars worth of donated advertising time and space to encourage guilty consumers to put litter in its place. Of course since the responsibility for litter rests with individuals, KAB leadership strongly opposes a national bottle bill that would place a deposit on glass and metal drink containers. In effect, KAB is a PR front group for industries that refuse to be responsible for the trash they generate in the course of doing business.

The Selling of Earth Day

On April 22, 1985 the major Washington-based environmental organizations celebrated Earth Day's 25th anniversary with a celebrity-studded tree concert in the national capital. In the intervening quarter century these groups had raised and spent billions of dollars in pursuit of environmental reform initiatives. In the White House they had as Vice President Al Gore, a mainstream environmental elder with a best-selling book of his own to prove it. In the nationwide opinion surveys consistently indicated that a solid majority of Americans strongly supported environmental protection initiatives.

Despite these trappings of accomplishment, the 25th anniversary celebration was a hollow shell of the once-vigorous environmental movement. Rather than stimulating a new wave of activism, it dumbed down the future of its national leaders and their policies of compromise and respectability.¹⁶

The first Earth Day in 1970 began when Wisconsin Senator Gaylord Nelson, a staunch conservationist, borrowed the idea for a student environmental teach-in from the tactics of anti-war organizers. Nobody *owned* the first Earth Day, the marches, demonstrations and protests mushroomed almost spontaneously, manifesting the power of aggressive 1960s-style activism. Many of its organizers saw the common systemic roots of both the war against Vietnam and ecological destruction. Denis Hayes, a national student coordinator spoke passionately to the first Washington, DC, Earth Day rally: "Our country is stealing from poorer nations and from generations yet unborn... We're tired of being told we are to blame for corporate depredations... institutions have no conscience. If we want them to do what is right, we must *make* them do what is right."²

The term 'corporate greenwashing' hadn't yet been coined, but the problem already existed. Political and business leaders once hoped that they could turn the environmental movement into a massive 'anti-litter campaign', shouted Hayes in his historic speech. Industry has turned the environmental problem over to its public relations men: "We have learned not to believe the advertising."³

Two decades later, however, Gaylord Nelson himself helped turn Earth Day into a corporate commodity. Since losing his 1986 bid for re-election, Nelson has been a lobbyist and consultant with the Wilderness Society, a prestigious mainstream environmental group that accepts funding from WMI, Archer Daniels Midland and other multinationals.⁴ In 1991, Nelson and environmental business consultant Bruce Anderson created an umbrella organization titled 'Earth Day USA' to orchestrate and fundraise for the event's 25th anniversary. Unlike previous Earth Day organizations, however, Anderson and Nelson encouraged corporations to buy into their 'official' Earth Day without any standards to screen out major corporate polluters. Anderson justified this approach by arguing that "we're all to blame, every one of us. If a business says they want to improve their environmental record, it's not up to Earth Day USA to be the judge and jury of their past behavior. Confrontation is the old way. We have to work together hand in hand, arm in arm, or we're wasting time bickering while the planet burns."⁵

Nelson agreed. Greenwashing, he said, is no problem at all—not even on the map. If a corporation is moving to be green, that's just fine. Many of today's corporate leaders participated in the first Earth Day in college; it turned them into environmentalists. I'm glad

to see corporations joining in. If they try to coopt Earth Day, they'll just help spread environmental propaganda.⁷³

Nelson also defended Earth Day USA's shocking decision to hire Shandwick PR—a leading *anti-environmental greymasher*—to help plan, coordinate and execute the twenty-fifth Earth Day celebration. "I have no concerns about that," Nelson said. "They are a PR firm. They represent all kinds of people. It's like hiring a lawyer. If he represents a murderer or a crooked businessman, that's what lawyers do. Am I not to hire him?"⁷⁴

Of course PR firms are not law firms, although practitioners promote the comparison to dignify their profession and to rationalize their work for unsavory clients. Bruce Anderson made the decision to hire Shandwick at a greatly reduced fee after a breakfast meeting in Washington, DC, with company executive Allen Finch. Anderson said he was impressed with Allen Finch's attitude: "I see this commitment to Earth Day USA expanding every day. He looks at it the same way I do. Earth Day is an incredible gift with a potentially tremendous impact."⁷⁵

No doubt Allen Finch *did* see Earth Day as a tremendous "gift" much the way a fox would relish managing the chicken coop. Finch's work for Shandwick includes personally representing one of the oldest, most notorious anti-environmental front groups, called the Council for Agricultural Science and Technology (CAST). Founded in 1972, CAST is funded by hundreds of companies invested in genetically engineered foods, agricultural chemicals, food additives and corporate factory farming, including Dow, General Mills, Land O'Lakes, Ciba-Geigy, Archer Daniels Midland, Monsanto, Philip Morris, and Unilever. According to *O'Dwyer's PR Services*, Allen Finch personally works to establish CAST as "the source for public policy makers and news media on environmental issues."⁷⁶

CAST is a classic industry front group claiming to provide current, unbiased scientific information concerning food and agriculture. In fact, for over two decades CAST has vigorously and predictably defended and promoted pesticide-contaminated foods, irradiated fruits and vegetables, and the use of hormones and drugs on farm animals. The hundreds of industry and university researchers who belong to CAST are often on the receiving end of large grants and other payments from the same agribusiness corporations that subsidize CAST.

When Earth Day USA hired Shandwick, its other PR clients included Ciba-Geigy, Chase Manhattan Bank, Ford Motor Company,

Hydro-Quebec, Monsanto, Pfizer, Procter & Gamble, Purina Mills and Sanjourno Bank. Shandwick's net receipts totaled over \$11 million in 1992 for "environmental public affairs services." As an example of these services, Shandwick cites its success in helping the Western Livestock Producers Alliance win its battle against raising grazing fees on public lands — handing the environmental movement one of the biggest defeats it suffered in the 103rd Congress.²⁶

In 1994 Shandwick PR claimed that "we're helping companies maximize green market opportunities, mitigate environmental risks and protect the bottom line — with access to the corridors of power at the federal level and every state capital, local business community and newsroom."²⁷

With Allen Finch on board, Earth Day USA began meeting with the Clinton White House and various corporations to make April 22, 1995, the biggest eco-publicity blast of all time, with a prominent role for corporate contributors. What about decisions by previous national Earth Day groups to screen large corporate contributions? According to board member Jerry Klamon, that approach was *false*. "We would work with companies others probably wouldn't because we see the need for the carrot approach. These companies need to be nurtured and brought along." Klamon's St. Louis group accepted funding from Monsanto and relied on the donated PR work of Allen Finch's St. Louis affiliate. "We need to use tactics that people are habituated to following," Klamon said. "These PR people are obviously good at penetrating the American consciousness."²⁸

Earth Day USA raised hundreds of thousands of dollars from businesses, including clients of Allen Finch's PR firm. Gifts of \$15,000 or more came from Procter & Gamble, Honeywell, Ralston Purina, Kinkos, Piushury and AT&T.²⁹ For \$20,000 a company could become an Earth Day USA sponsor. Further negotiations could buy permission to use the official Earth Day USA logo. An internal Earth Day USA memo contemplated the spin-off of a second organization called the Earth Day Corporate Team, consisting of environmental leaders within corporations in the United States — organized as a separate nonprofit corporation, but with its board of directors dominated by the leaders of Earth Day USA. The team would enhance the fundraising opportunities for Earth Day USA and the other members of the Earth Day Family. To protect its own image, Earth Day USA would retain some independence from its corporate arm to preserve the innocence and inclusiveness of the Earth Day spirit.³⁰

In the end, the inclusive pro-corporate strategy of Finch, Anderson, and Nelson fell apart when media coverage disclosed the corporate greenwashing behind Earth Day USA. Unwanted publicity led to internal dissension and the eventual breakup of the organization's board of directors. Efforts to involve the Clinton White House in raising millions of dollars from corporations to fund a huge event on the DC mall also fell apart under reporters' scrutiny.

Begging for Mercy

The whimpering demise of Earth Day USA epitomized the crisis that had come over the environmental movement by 1998. The good cop strategy of many environmentalists to sleep had proven a smashing success. With the exception of a Republican minority in Congress, the tandem green organizations found themselves effectively cut out of the cop — another remnant of a dying liberalism. The new Congress proved quickly to eviscerate the past legislation and regulations that had been the green lobbies' major accomplishments. The professional environmental lobbyists — cut off from the grassroots they had courted — were unable to turn up any significant heat on legislators. In desperation, some environmentalists drafted a pleading petition addressed to the political architect of their demise, former professor of environmentalism Newt Gingrich:

In fact the corporate victory was so complete that the public relations industry was quietly advising its corporate clients to refrain from gloating. The February 1995 issue of *O'Dwyer's PR Services* said green PR people "should ride the Republican fueled anti-environmental backlash wave as far as possible." Green PR pros are salivating at the chance to prove their worth to clients. They are ready to navigate the thicket of regulations in DC, select those most appealing to clients, and convince lawmakers to dump them. But O'Dwyer warned, they should not be greedy because overreaching may come back to haunt them once the sun sets on the pro-business Republicans and greenies are again on the rise.¹³

Similar advice came from Michael Kehl, head of Burson-Marsteller PR's worldwide environmental practice. Don't appear greedy by complaining how much compliance with green laws costs. That could jeopardize years of good works and crucial corporate positioning. The business community enjoys the upper hand. There is a new contract on the street. And although the word "environment" is never mentioned, many observers believe it's less a contract with America than a contract on environmental busybodies.

There is no better time to extend an olive branch.

In his rather the Earth Day 1995 release of *A Moment On The Earth: The Coming Age of Environmental Optimism*, a 745 page exercise in sophistry by Gregg Easterbrook, seemed like dirt in the face of the losing green lobbyists.¹⁴ Cancel your plans for doomsday planet earth is alive and well screamed the book's full page *New York Times* advertisement. Easterbrook's one-sided and tactfully deformed tract promoted his pollyannish doctrine of "ecorealism." While defensively proclaiming himself a liberal and an environmentalist, he provided the PR greenwashers with their best manifesto to date, written by an "objective" journalist.

Easterbrook's own mother died of breast cancer after working in the notorious Hooker Chemical plant that produced the toxic wastes buried at Love Canal, yet *A Moment on the Earth* claims that all major environmental crises are virtually solved or never really existed in the first place. It argues that corporate capitalism has embraced environmental and social responsibility and will soon end all pollution, and accuses environmentalists of denying these "facts" in order to sustain their fear-based fundraising campaigns.¹⁵

Ironically Easterbrook's book was completed just before the anti-environmentalists seized Congress and began dismantling the various regulations that the earned had guaranteed in ecological slopa-

In an Earth Day column in the April 21, 1995 *New York Times*, Lester Brooks never showed as he publicly pleaded with industry to end its lobbyists' assault on environmental regulations. Has all the apparent progress in the chemical industry been merely a public relations ploy? Lesterbrook wondered with apparent genuine consternation:²⁹

Notwithstanding the advice from O'Dwyer's to "avon [sic] overtaking," the PR industry was already positioning itself for a no-holds-barred assault on the greens—the bad cop component of its good cop/bad cop strategy. Now solidly in the political driver's seat, polluting corporations could relax in their efforts to coopt and partner with environmental groups. *PR News*, an industry publication acknowledged that "since Earth Day more than 20 years ago, a generation of PR executives have become accustomed to donning the green hat." But now it advised the rise of anti-environmentalism "presents an opportunity for PR executives at corporations and firms to play the advocate role not for corporate environmentalism but for the fuddy anti-environmental 'Wise Use' groups."

In fact, H&K, Knowlton-Burson-Marsteller, Edelman PR, Shandwick, Fleishman-Hillard, Bruce Harrison and other greenwashers had been working for Wise Use all along. But now they could come out of the closet since their tactics of cooption had the red-greens on the run.

Crafty Alliances

The *Washington Post* reported that even a decade ago, Burson Marsteller's DC office alone had five PR specialists concentrating only on designing coalitions for clients.³⁰ As one PR executive explained it, these astroturf coalition designers "are building allies and neutralizing the opposition." James Linchheim, Burson Marsteller's former director of workflow of public affairs, put it this way: "Don't forget that the chemical industry has many friends and allies that can be mobilized—employees, shareholders and retirees. Give them the songsters and often be p[ro]industry every the time."

Sometimes the public catches on. A group called Citizens to Protect the Pacific Northwest and Northern California Economy was formed in 1993 by timber company executives who paid about \$5 million from citizens asking people to send back a signed record if they agreed with the group's goals. State auditors were then appointed. When asked what he was going to do, the group's Washington state co-chair replied: "I haven't been brought up to do it on

what their agenda is going to be? A *Seattle Post-Intelligencer* editorial put it this way: "To hire a press agent to cook up a campaign pay all that campaign's bills and then claim that the campaign was founded by more than 100 prominent community leaders in Oregon, Washington and Northern California is too crafty by half."

More recently, National Audubon Society board member Leslie Dach was embarrassed when *O'Dwyer's Washington Report* noted that his PR firm, Edelman, was organizing publicity and security for the June 1995 Fly In for Freedom—the Wise Use movement's annual lobby event in the nation's capital, sponsored by the Western States Coalition. Dach attempted to distance himself from the event by stating that he personally never had any involvement with the Coalition. Actually, he epitomizes the dual "good cop/bad cop" strategy that co-opts environmental groups like Audubon on the one hand, and wages war against them on the other.¹

Dach handled PR for Democratic presidential candidate Michael Dukakis and is now an executive vice president of Edelman PR and the General Manager of their DC operations. Edelman's right-wing contingent includes Michael Deaver who, like Dach, is also an Edelman executive VP. Deaver was the PR genius behind Ronald Reagan and helped develop the 1984 Republican "Contract with America." Edelman is a leading anti-environmental greenwasher. According to *O'Dwyer's PR Services*, "the firm's executives have a broad range of environmental expertise and have managed numerous issues surrounding Superfund, the Clean Water Act, the Resource Conservation and Recovery Act, wetlands preservation and public lands."² Edelman's client, the Alliance for America, is an industry-subsidized network of 650 anti-environmental companies and associations that are the backbone of the Wise Use movement. At the 1995 Fly In for Freedom, Edelman helped the Alliance target the Endangered Species Act for elimination.

No More Mr. Nice Guy

Wise Use is the brainchild of Alan Gottlieb and Ron Arnold—respectively founder and director of the Bellevue, Washington-based Center for the Defense of Free Enterprise—the premier think tank and training center for the Wise Use movement—according to the *Greenpeace Guide to Anti-Environmental Organizations*. The founding funders of the Center include the timber firms Georgia-Pacific, Louisiana-Pacific, Boise Cascade, Pacific Lumber and MacMillan Bloedel along with companies like Exxon and DuPont. The Wise Use agenda is

simple," says Arnold. "We intend to wipe out every environmental group by replacing it with a Wise Use group."

The public relations industry has been closely involved with Wise Use since its founding, according to Lyle Nelson, the author of *Subtans of Sleaze: Public Relations and the Media*. Nelson writes that 56 of the corporations that are known to fund the Wise Use movement in the United States were clients of the PR firm Burson-Marsteller in the 1980s, the period during which industry began to pour money into organizing grassroots anti-environmentalism.¹

To recruit and mobilize its troops, Wise Use relies on standard PR techniques of astroturf organizing. "Pro-industry citizen activist groups can do things the industry can't," explained Arnold. In a candid talk to the Ontario Forest Industries Association, Arnold elaborated on the benefits of a citizen front group strategy. "It can form coalitions to build real political clout. It can be an effective and convincing advocate for your industry. It can evoke powerful archetypes such as the sanctity of the family, the virtue of the close-knit community, the natural wisdom of the rural dweller, and many others I'm sure you can think of. It can use the tactic of the intelligent attack against environmentalists and leave the battle to them instead of forever responding to environmentalist initiatives. And it can turn the public against your enemies."

The first Wise Use conference, held in 1988, was supported by a variety of special interests including Exxon and the National Rifle Association. The highlight of the conference was the presentation of Alan Gottsch's "Wise Use Agenda," which listed goals such as:

- rewriting the Endangered Species Act to remove protection from non-adaptive species like the California Condor
- immediate oil drilling in the Arctic National Wildlife Refuge
- opening up all public lands to mining and energy production including national parks and wilderness areas
- turning the development of national parks over to private firms with expertise in people moving, such as Walt Disney
- imposing civil penalties against anyone who legally challenges economic action or development on federal lands

The 1990 conference, funded by Chevron, Exxon, Shell Oil and Georgia-Pacific, featured a talk by Reed Lyons of Accuracy in Media and Accuracy in Academia. Titled "Red Into Green," Lyons's talk claimed that environmentalism is the latest incarnation of socialism.²

Irvine's groups are bankrolled by Dresser Industries, Chevron, Ciba Geigy, Exxon, IBM, Kaiser Aluminum and Chemical, Union Carbide, Phillips Petroleum, Mobil Foundation and Texaco Philanthropic Foundation, among others.⁶⁹

Also at that conference, the right-wing Mountain States Legal Foundation gave three seminars on suing environmental organizations. Mountain States Legal Foundation is funded by companies including Amoco, Exxon, Ford, Texaco, Phillips Petroleum, Chevron and the Coors Foundation. Our intent is to sue environmental groups whenever there is a legal reason to do so, Arnold said. We feel that whenever any environmental group tells lies that have an economic harm against anybody, that is a civil tort, and under US law they should be vigorously prosecuted in civil court.

And if lawsuits fail, some anti-environmentalists urge even stronger tactics. Former Interior Secretary James Watt (who in 1988 pleaded guilty to trying to influence a federal grand jury) told a gathering of cattlemen in June 1990: If the troubles from environmentalists can not be solved in the jury box or at the ballot box, perhaps the cartridge box should be used.⁷⁰

CHAPTER TEN

The Torturers' Lobby

If I wanted to be—or if we wanted to be—if we wanted to exaggerate—I wouldn't use my daughter to do so. I could easily buy other people to do it.

SAUD NASIR AL-SABAH

Kuwait's Ambassador to the United States and Canada

On October 10, 1993, the Bogota newspaper *El Tiempo* reported with satisfaction on President Clinton's remarks at a ceremony for Colombia's new ambassador to the United States. The President praised Colombia as a "valued trading partner" and "one of our strongest allies, not only in the effort to free the world of the scourge of narcotics trafficking, but also in our common desire to see democracy flourish and the rule of law prevail throughout the region."

More than any nation in this hemisphere, Colombia has suffered at the hands of the drug traffickers, Clinton said. "The courage your people have demonstrated at all levels—from the President to the prosecutor to the policeman on the street and the soldier in the field—merits our respect and thanks."

The following day a group of soldiers in the field killed three peasants—two men and one woman—and dumped their bodies in front of the Catholic bishop's residence in El Boqueron, Colombia's Santander region. The bishop, Monsignor Luis Madrid Merlano, condemned the killings and the fact that soldiers displayed the bodies in the street for three hours before allowing them to be removed. In response to the Colombian army's accusation that the peasants had been subversive guerrillas, Madrid Merlano noted that the owner of the farm where they worked told me that they had been employed there for more than 20 years; and the woman who was killed was the trusted cook of the household.

Colombia's policemen in the street and soldiers in the field commit similar atrocities on Itero's a daily basis. The country's dismal human rights record prompted Amnesty International to publish a special 1984 report titled *Truth and Reality*, which held government forces responsible for most of Colombia's human rights violations. Similar reports have come from human rights organizations including Americas Watch and the Inter-American Human Rights Commission of the Organization of American States. The Andean Commission of Jurists, a human rights organization with offices in Bogota, has compiled data showing that Colombia's police and armed forces were responsible for 70 percent of the country's twelve political murders per day during 1983. Human rights groups estimate that there are at least 300,000 internal refugees in Colombia today and about 50,000 more who have fled to Ecuador. Of 200 unionists assassinated worldwide from January 1990 to March 1991 over half were Colombian, according to the International Confederation of Free Trade Unions in Brussels.

There is an almost surreal absurdity in Clinton's kind words of respect and thanks to the infected authors and physical perpetrators of these crimes—particularly since Clinton's words were packaged in a speech in which he also declared: "A who abuses human rights regardless of their ideology or position must be punished severely and swiftly." But President Clinton was simply expressing a common illusion in the United States: the notion that Colombia's human rights problems are side effects of the country's war on drugs. As Mireya Salazar of the Andean Commission of Jurists observes, this perception is the result of continual posturing by the government of Colombia. They present themselves as victims and say, "Things are very difficult for us in confrontations [leading to] thickets and sanctuaries there are problems," Salazar says. They have presented a good image for themselves, and they even say that they are in the vanguard of the struggle for human rights—but we have to look at their actual practice.

From Villain to Victim

Until a decade ago, the government of Colombia didn't pay much attention to its international image—but in the mid-1980s it began to show concern about its growing reputation as a compliant haven for the world's largest drug empire. An opinion poll in 1987 showed that 76% of Americans thought the Colombian government was corrupt and 82% wanted sanctions imposed. The country's image

suffered an additional blow in 1991 when the government stopped extradition of drug traffickers to the US and negotiated an in-country surrender of Pablo Escobar, the head of the notorious Medellin drug cartel. At the time Escobar was facing nine indictments in the US for drug trafficking and murder. Under the terms of the surrender he was picked up by a government helicopter and flown to a maximum security jail dubbed the 'Hilton prison' by US Congressman James Trachte. Escobar's mountaintop jail came equipped with jacuzzi, air conditioning, three huge bedrooms and a guest room, walk-in closets and private baths, phone and fax machines, a soccer field, a game room, and a panoramic view of the Medellin Valley. He was also allowed to designate his own prison guards, and although police were banned from entering the prison, well placed babes enabled Escobar to escape and surrender at will.

The catch-up is badly scored though: the Colombian government turned to the Sawyer Miller Group, a top media consulting firm. Sawyer Miller had been carrying out political campaigns for Democratic Party candidates including Senators Daniel Patrick Moynihan, Ted Kennedy and John Glenn, as well as 1984 vice-president candidate Geraldine Ferraro. In the mid-1980s, the firm shifted from election campaigning to 'issue management' for corporations and international clients.¹

After concluding opinion, fails to evaluate the public's opinion of Colombia. Sawyer Miller concluded that the country's image was so negative that an attempt to improve it through positive publicity would be counterproductive or even propagandistic. Instead, the firm devised a two-stage campaign first reposition Colombia in the public mind from victim to victim. Then turn the victim into a hero and then a leader in the war on drugs.⁶

In 1981 alone, Colombia poured \$34 million into the campaign, which began with newspaper ads and TV commercials targeted at Washington policymakers. The commercials showed stark images of a beat-up dead car, a cotton field, and itinerants. A voice-over recited a list of prominent Colombians indoctrinated by drug traffickers. It asked viewers to remember the Colombian heroes who are dying every day in the war against arms. Another ad attempted to swing the focus away from Colombia's role as drug supplier to the U.S. market consumer. It showed a young woman standing in line at a bank with a caption that said: Drug User or Drug Terrorist? How can we also consider her a drug terrorist? After all, they young American... is never built a bomb or lied a gun. But because of her parents, let us say

is directly supporting the drug terrorists who are tearing apart our country. We—and she—have to win this war together.

Look at the press clips from then on,” bragged Sawyer Miller’s Dick Leslie. “News stories, columns, editorials, it start taking more and more about demand.”¹⁸

In addition to advertising, Sawyer Miller pumped out pamphlets, video news releases and letters to editors signed by Colombian government officials. All requests from US journalists for interviews with Colombian officials were channeled through Sawyer Miller. Simpler, the reporters got quick access while critical journalists were turned away. Sawyer Miller also organized meetings between Colombian government officials and newspaper editorial boards, putting favorable stories and stressing Colombia’s value as a US trading partner. Following a meeting with *New York Times* Magazine editor Warren Floge, the *Times* ran a lengthy, tactfully slanted profile glorifying Colombian President Cesar Gavira Trujillo—whose election campaign in fact had been heavily funded by drug cartels. After the article appeared, the Colombian embassy bought reprints and sent thousands of copies to journalists around the United States.

Another Sawyer Miller ad featured a line-up of dead or killed drug leaders. These men once ran the world’s largest drug empire, said the text. They murdered thousands, terrorized a democratic nation and turned the profits of cocaine into eyes of luxury. “No country has paid a higher price in the war on drugs than Colombia. But we’re not over—but every day brings evidence that democracy can triumph over drugs.” The ad put a favorable spin on Colombia’s long drug of Pablo Escobar, claiming that Escobar is out of business and in jail. His prison is like none in the US, ringed by barbed wire and electric fences. A Colombian Army battalion surrounds it. Soon Pablo Escobar will be tried for his crimes.¹⁹

In fact, the Colombian Army’s frequent collaboration with drug traffickers is common knowledge in Colombia. Instead of *Paz*, a Colombian human rights organization comprising 55 religious congregations has documented the links between drug cartels and army-supported paramilitary groups to carry out covert death-squad activities as part of Colombia’s decades-long guerrilla war. They use very savage methods such as cutting off people’s arms and legs with chainsaws, said a *Justicia y Paz* researcher speaking anonymously for fear of personal retribution.

As Colombia’s image graduated from ‘victim’ to ‘hero’ in the war on drugs, the government’s acts of brutality and repression were cast

as "tough but necessary measures." In 1991 Colombia began a judicial reform known as the system of faceless justice. In cases brought before the faceless courts, judges are kept hidden behind a partition that renders them invisible to defendants and their attorneys. Special electronic equipment is used to disguise the judge's voice. Prosecuting attorneys and witnesses may also have their identities kept secret, and defendants are even denied access to information about the legal process and the evidence that has been brought against them. The system is supposedly aimed at protecting Colombian judges from intimidation and assassination by narcotics terrorists, and received glowing praise in December of 1993 by *60 Minutes*, which ran a segment extolling the bravery of the Colombian judges who serve on the faceless courts. Cecilia Zarate, a Colombian woman active with human rights groups in the United States, had a different opinion: "Secret judges, secret witnesses, secret evidence—this is really scary. In Latin culture, people have a vivid historical memory of the killings, tortures and injustices that went on under this type of system during the Spanish Inquisition. It's horrible that they should be bringing this back, really horrible."

The Center for Investigation and Popular Education (CINEP), a highly respected Jesuit organization which monitors human rights conditions in Colombia, examined the system of faceless justice and discovered that 58% of the 618 persons prosecuted under these special courts during the first six months of 1992—that is, 91 percent—were persons engaged in social protests or civic organizing, while only 9 percent consisted of drug trafficking or guerrilla cases.

After workers with the state-owned telephone system went on strike, for example, the government charged that the disruption of phone service constituted terrorism and arrested 13 union leaders. Other union members became victims of unprovoked violence. The government used a strategy of implausible denial to account for the death of Telecom union member Jose Joaquin Greco Argote. After he was strangled, gasoline was poured on his body, and he was set on fire. The government's investigation into his death concluded that he had committed suicide. Later that year, a car bomb claimed the life of another Telecom worker, a technician named Genaro Gavira. The government listed his murder as unsolved.

These official explanations serve two functions, said Jack Lewin, a Wisconsin attorney who has been active for many years in human rights groups. Before the international community they enable the Colombian government to represent itself as innocent of

crimes committed by its agents. To the victims of these crimes, on the other hand, they send a very different message. The government is announcing to the workers of Telecom: We can kill you with impunity, and whatever we say about it afterwards will be believed.

Meanwhile, Colombia's justice system remains notorious for its withholding of drug dealers. Pablo Escobar's death in a 1993 shoot-out merely transferred power from his hands to a rival cocaine cartel in Cali, with no appreciable impact on the drug trade. After Ernesto Samper replaced Gaviria as president of Colombia, investigators discovered that Samper had received campaign contributions from the Cartels. Samper attempted to counter this revelation by launching a highly publicized crackdown on the druglords, but journalist Steven Gutkin noted that "cartel leaders may actually prefer to be behind bars for a while." More than a thousand drug dealers in the drug trade have already taken advantage of lenient anti-narcotics legislation after surrendering or cutting deals after being arrested. The average sentence has been three years, far less than the punishment for carrying an unlicensed gun. No one expects a significant decrease in the amount of drugs entering the United States. The government must come through with meaningful prison sentences—not public relations ploys to appease the United States.

Flocking for the Fascists

Governments that murder and afflict the poor don't particularly need to worry about maintaining an attractive image among their own people. Their police repressive efforts are targeted primarily at an international audience—in particular to export stories, press releases and news items, responsible for shaping trade and foreign aid policies.

Contemporary mass communications play quite a few as an important role—and certainly a more covert and sophisticated one—in technologically advanced democratic societies where the maintenance of the existing power and privileges are vulnerable to popular opinion. writes Australian scholar Alex Carey. He cites a study by Robert Rydell of Princeton during the first half of the twentieth century which shows that "brands speaking the importance of participation, decreases as one moves away from countries with strong and deeply seated liberal democratic and parliamentary institutions."

Brands that have adopted the most expensive, most controversial and the most produced the best results, according to the study. What took the branding of fascism's "good experience" to victory in Nazi Germany? National Socialist propagandists

was by far the best organized — more virulent and more systematic than the propaganda of either Italy or Japan. At the other end of the scale that is among countries with the longest experience of liberal democratic institutions, relations propaganda — in the United States — is more lucid, accurate and instructive than it has ever become even in England.¹⁴

In 1933 the Nazis turned for guidance to Ivy Lee, the US pioneer of public relations. Lee's firm was hired for \$25,000 per year by the German Dye Trust, IG Farben, which invited him to visit Germany and meet Hitler along with propaganda minister Joseph Goebbels and other Nazi government officials. Lee's 25-year-old son, James Lee, went to work for Farben in Berlin for \$33,000 a year. An employee of Lee's firm drafted a report suggesting that Joachim von Ribbentrop, the German general who later became Hitler's foreign minister, undertake a lecture campaign to clarify the American mind by speaking over the radio to the American people and writing a considered article for an important American publication.

Max Ilgner, the IG Farben official who hired Lee, was a member of the Nazi Council of Experts of the Propaganda Ministry. After World War II he was convicted as a Nazi war criminal by the Nuremberg Military Tribunals. According to the Nuremberg prosecution, Farben's foreign agents formed the core of Nazi intrigues throughout the world. Financed and protected by Farben and ostensibly acting only as businessmen, Farben others carried on propaganda, intelligence and espionage activities indispensable to German preparation for and waging of aggressive war.

In 1936 Ivy Lee's work for Germany brought him before the US House Special Committee to answer charges that he was a Nazi propagandist. Lee claimed that his meeting with Hitler was just as a personal favor to size him up and said he had advised the Germans to abandon their persecutions of the Jews. These moralizations failed to satisfy Congress, which in 1938 passed the Foreign Agents Registration Act (FARA) requiring anyone who engages in US political activities on behalf of a foreign government to register with the Criminal Division of the Justice Department. Under FARA it is illegal for a foreign interest agent to make political contributions of for a US government official to act as a foreign agent.

In practice, however, FARA is virtually useless. Many lobbyists do not even bother to register, and those who do provide only the minimum required information, writes author Susan Trent. When violations are discovered, little action is taken.¹⁵

Banana Republicans

Many of the big spenders in Washington lobbying and PR are governments with severe human rights abuses including Taiwan, South Korea, Pakistan, Mexico and Saudi Arabia. In 1992 the Washington-based Center for Public Integrity published a study titled "The Torturers Lobby" showing that Washington lawyers and lobbyists, many of whom served as top political advisors to Presidents Reagan, Bush and Clinton, were raking in more than \$50 million a year by helping repressive governments improve their images. PR giant Hill & Knowlton topped the list with \$14 million in receipts from countries with documented records of abuse, torture and imprisonment including Kuwait, Indonesia, Israel, China, Egypt and Peru. China of course uses strict media censorship and political prisons to control its population. In 1989 it carried out the infamous massacre of hundreds of pro-democracy students in Tiananmen Square. Other examples cited by "The Torturers Lobby" included:

- Turkey which got \$800 million in US aid despite being charged by the State Department with widespread human rights abuses spent \$38 million around to Capitol influence peddlers including \$1.2 million to Hill & Knowlton.
- Guatemala whose genocide against its indigenous population as described in the autobiography of Nobel prize-winner Rigoberta Menchu had cost \$650,000 for Washington lobbying. During 1991-92 while hundreds of Guatemalans were executed for resistance fees totalling \$220,000 went to the Washington firm of Patton Boggs & Bow, whose partners included Democrat National Committee Chairman Ron Brown (President Clinton's Commerce Secretary).
- Nigeria's military government spent \$26 million from 1981-82 over \$1 million of which went to Barson Marsteller's subsidiary Black Manafort Stone & Kelly, one of the top five firms in the torturers lobby. In addition to Nigeria the firm collected another \$1.2 million in fees from the Republic of Kenya and Angolan UNITA rebels.¹⁶

In some cases, the Torturers Lobby showed that countries were spending a large part of their foreign aid from the United States to subsidize Washington lobbyists. Nigeria's \$26 million in lobbying fees for example represented nearly a third of its \$83 million in US aid. "The system stinks," said Mikail Mutab, director of Harvard Law

School's Human Rights Project. It's morally objectionable and this influence peddling. There's no doubt several of these countries couldn't afford these lobbyists without the help of the American taxpayers."¹⁹

Everybody Needs Some Bodies Sometime

Some PR firms argue that they are ethically *obligated* like attorneys to accept virtually any client who can afford to pay. Reagan era powerhouse Gray & Company's clients included the murderers Baby Doc Duvalier in Haiti. In her biography of Robert Keith Gray author Susan Trento says the company's rationalizations to explain working for Haiti utilized an Orwellian logic that would be dazzling if it weren't so appalling. According to company executive Adams Holloman "The government of Haiti tank it wherever you will... is entitled to make its position known in Washington to the US government and has the right to try to get its side of whatever the story is to the media and to the American public. In order to do that they are going to have to retain a firm that knows how to do these kinds of things... By definition people who hire lobbyists and PR people have problems, they have fears, and they have needs."

Trento comments sarcastically "It was as if one of the most brutal dictators of the twentieth century were a poor lost soul seeking his inner child and Gray & Company a benevolent kindly therapist."

In his pre-Carton days Ron Brown also personally represented the Duvalier government while working for Patton Boggs & Brown in the early 1980s. Duvalier finally fled Haiti in 1986 to escape a popular uprising and power passed through the hands of a quick succession of unpopular governments until December 16, 1990 when Haiti held the first democratic elections in the country's history. Jean Bertrand Aristide, a native Catholic priest received 91 percent of the vote in a field of 23 candidates and assumed office on February 7, 1991. Eight months later however soldiers led by Lieutenant General Raoul Cedras and General Michel François surrounded the presidential palace, seized Aristide and sent him into exile. During Aristide's exile some 100,000 Haitians were killed by the Cedras regime. Haitian people from there began fleeing in large numbers to the United States and other neighboring countries. The United States and the Organization of American States declared a trade embargo against the military regime.²⁰

Cedras and Francois responded with a state coup, fighting against Aristide. After expelling him from the country they managed

through Aristide's diaries and personal effects in search of incriminating evidence. Predictably, the investigator concluded that Aristide was a "psychotic manic-depressive with homicidal and necrophilic tendencies." The junta transmitted these charges to the US news media through an array of hired lobbyists and PR representatives, including George Demougeot, who also represented US apparel firm with an assembly plant in Haiti, and Stephen A. Hartman and Walter E. Lantierov of Creative Associates International Inc.¹⁷ Another employee in the PR campaign was Darryl Reaves, a one-term Florida state representative who worked to arrange interviews and Capitol Hill connections for François and Cedras. Reaves avoided publicity for himself telling reporters, "I don't exist." When one journalist inquired too deeply, he responded with obscenities and vague threats that he would have the reporter arrested.

The regime's most visible lobbyist, however, was Robert McCandless. In addition to the anti-Aristide PR, McCandless represented a group of businessmen headed by Gregory Brandt whose interests in Haiti included cooking oil, cars, tomato paste and coffee. In March of 1992, McCandless accepted \$85,000 from the junta as part of a \$150,000 contract. In his FARA filing, McCandless said he would be working to direct favorable PR to Provisional Government and to provide PR against former President Aristide. "Everybody . . . try to get rid in money and in kind . . . In the spring of 1992, the Treasury department ordered McCandless to stop representing the Haitian government on grounds that he was breaking the embargo, but he continued to do so on what he claimed was now a 'pro bono' basis.

McCandless circulated post on papers and editorials in Washington. In an August 13, 1992 memo, he rebuked the Cuban rebels' claim that Aristide was a tyrant and a cruel and oppressive ruler and characterized the US trade embargo as a policy of genocide that would cause the deaths of hundreds of thousands of innocent Haitians. As a suggested compromise, McCandless proposed to end the crisis by letting Aristide return to Haiti, not to assume office but to face trial before a blue ribbon citizens panel on charges of embezzlement, inciting mob violence, torture and murder.

In his PR work for the provisional government, McCandless relied heavily on his friendship with conservative syndicate columnist Robert Novak, who obliged by visiting Haiti. McCandless invited him and writing a series of columns in support of the junta in a 1993 article titled, "Why So Hard on Haiti's Military?" Novak accused the Clinton administration of "uncharacteristic rigidity" for refusing to conduct

a negotiated settlement of exiled Haitian President Jean-Bertrand Aristide's return to power or even to hear conflicting advice. Warnings about Haiti began even before Clinton took office, when Washington lawyer Robert McCandless offered his invaluable contacts with the Haitian military and police to seek a solution. McCandless again has offered the president use of his relationship with Fanfani and Cetris to seek a peaceful solution.⁷

The Bush and Clinton administrations expressed support for Aristide as Haiti's elected president, but behind the scenes the junta had powerful allies in the CIA and in the offices of conservative US Senators Jesse Helms and Robert Dole. Its attacks on Aristide's character received extensive media attention when Helms organized a classified briefing with Brian Latelle, the CIA's intelligence officer for Latin America. The briefing, at which Latelle used a forged letter to document his false claim that Aristide suffered from psychological disorders, was promptly leaked to Novak at the *Washington Post*. Helms followed up by delivering a newsmaking tirade against Aristide on the floor of the Senate, labeling him a "psychopath" and claiming that Aristide had incited followers to murder his opponents.

With Friends Like These . . .

Ironically, the most effective PR work against Aristide may have come from his friends in far-flung places. Throughout the crisis, the US sponsored negotiations that forced Aristide to make repeated concessions. When Aristide failed to comply, US officials attacked his "intransigence," portraying his obstinacy as the primary obstacle to peace.

Gregory Craig, a well-connected Washington attorney, was a key player in shaping the Clinton policy. A former Yale classmate of the Clintons, Craig was hired in 1992 to represent the interests of Edouard Mevs, Sr., a Miami resident who made his fortune with a sugar monopoly under the dictatorship of François "Papa Doc" Duvalier. Mevs, along with his sons and other family members, have been called the main Master of Haiti. They reportedly started the military's dossier for Aristide. A report by the National Labor Committee, a labor advocacy group representing 24 unions, claimed that Mevs was one of the chief organizers of the coup and that the Mevs family made money smuggling cocaine in violation of the embargo.⁸

Mevs contacted Craig to discover what measures he should take to protect his interests as the Bush administration—insisted freezing assets of leaders of the coup. After determining that the US government had no proof of Mevs family complicity in the coup, Craig

agreed to become the family's personal lobbyist in Washington. Using his Clinton connections, Craig played a key role in shaping US policy toward Haiti after Bush left office.¹

The Bush and Clinton administrations vacillated for two years before finally taking action, while the junta's defenders repeated and refined their charge that Aristide was "just as bad or worse." The Clinton administration finally sent troops in to Haiti in September 1994 to impose a settlement that granted a full amnesty to the junta. After two years in exile, Aristide was allowed to resume office with barely 10 months remaining in his term, under an agreement that forbade him from running for re-election.

The true significance of Aristide's return to Haiti received a frank assessment from Major Louis Kermisau of the US Defense Intelligence Agency, who led the retraining of Haiti's "new, reformed" police force. You're going to end up dealing with the same folks as before—the five families that run the country—the military and the bourgeoisie, Kermisau said. They're the same folks that are supposed to be the bad guys now—but the bottom line is you know that you're always going to end up dealing with them.

Them vs. Us

The latter half of the twentieth century has been marked by growing disillusionment as the American people have learned of the gulf that separates official rhetoric from the actual conduct of US foreign policy. This disillusionment has led to a set of attitudes that on the surface seem paradoxical. On the one hand, the people of the United States donate billions of dollars each year to overseas charitable causes, and although attitudes about most aspects of US foreign policy tend to vary with the times, surveys of public opinion consistently show a deep concern about the plight of needy people in other countries. According to one survey, 89% of the American people feel that "wherever people are hungry or poor, we ought to do what we can to help them." Only 5% feel that fighting world hunger is "not important." Eliminating world hunger and poverty rank far ahead of protecting American business abroad—and even ahead of defending our allies' security—as an international concern.²

On the other hand, the public's attitude toward government foreign aid programs has been thoroughly negative since at least the early 1970s, when pollsters began taking surveys on that question. When asked to volunteer their views of the two or three biggest foreign policy problems facing the nation, respondents regularly

identify reducing foreign aid as one of their top concerns.¹ According to the Gallup polling organization, a sharp difference has emerged between the attitudes of the general public and the attitudes of people that pollsters (somewhat misleadingly) designate as opinion leaders — i.e., heads of business, the professions, politicians, the news media and labor union officials. With respect to economic aid, over 90 percent of opinion leaders support it, but the general public favors such aid by only a thin margin. Most people see foreign aid as helpful to the economies of recipient countries but not to the United States. Moreover, they perceive it as benefiting the rich more than the poor, and 75 percent feel that it gets the US too involved in other countries' affairs.² Public support for military aid is even weaker. Although it still receives the support of a two-to-one majority among opinion leaders, roughly the same majority within the general public opposes military aid. Moreover, four out of five Americans believe that military aid "lets dictatorships repress their own people" and five out of six believe that it "aggravates our relations with other countries" and "gets us too involved in their affairs."³

At the same time, the field of foreign policy offers a fertile breeding ground for propaganda. Most efforts at molding public opinion target the portion of the public which is undecided, uninformed or vaguely informed about an issue, and foreign countries are by definition faraway places inhabited by people whose language and customs are unfamiliar and different from ours. It is no accident that the US public relations industry first rose to prominence as a result of the Greek Committee's propaganda efforts during World War I. Every successive war has brought new innovations and growth in both the technique and scope of public relations.

Wartime propaganda has a long history, going back to Antiquity. The classical rhetorical model is crude but effective. Before ordinary human beings can begin the organized killing known as war, they must first kill their opponents psychologically, observes Vincent Kryszoski. This is the ritual, as old as civilization itself, known as becoming enemies. The enemy is described by our leaders as not like us, almost inhuman. They are evil. They are crazy. They are intent on destroying us and all that we love. There is only one thing the enemy understands: violence. This logic of the enemy image leads to one inescapable conclusion: the enemy must be killed. Indeed, destroying the enemy is an heroic act, an act of salvation and purification.⁴

Author John MacArthur notes, for example, that during World War I, the French and British seized on Germany's conquest of Belgium for propaganda purposes. The British-sponsored Bryce Committee claimed that German murder, lust and pilage prevailed over many parts of Belgium on a scale unparalleled in any war between civilized nations during the last three centuries. The committee's claims, which were never documented or corroborated, included allegations that German soldiers had publicly raped Belgian girls, bayoneted a two-year-old child, and mutilated a peasant girl's breasts. The *London Times* claimed that a witness had seen Germans "chop off the arms of a baby which clung to its mother's skirts" — a story which was embellished further when the French press published a drawing showing German soldiers eating the hands.¹

One of the striking features of war in the late half of this century has been the degree to which it has become closely integrated with sophisticated public relations, to the degree that military strategy itself has been transformed. For propaganda reasons, war has been redefined using new terminology—as a "police action" or "limited engagement." The dead have become "casualties," "missing in action" or the result of "collateral damage" and "friendly fire."

The Vietnam War contributed substantially to the military's new emphasis on propaganda and psychological warfare. The war's planners realized that the use of US troops to accomplish traditional military objectives—capturing and holding territory—backfired when the US presence inspired anti-American nationalism among the Vietnamese. As the conflict dragged on, the steady stream of soldiers returning in body bags fed anti-war sentiment at home. Future wars, the planners concluded, should avoid extended placements of US troops on foreign soil. Instead, they proposed two alternative strategies: (1) brief blitzkriegs using overwhelming force to quickly and decisively defeat the enemy; and (2) replacing US forces with foreign proxies, special operations forces and mercenaries to engage the enemy using guerrilla tactics of unconventional warfare. In either case, the psychological war for "hearts and minds" took precedence over the conventional war for terrain and physical assets.

Lightning Wars

The 1983 US invasion of Grenada, a tiny island nation with a population of 100,000 and a per capita income of \$300 per year, marked the adoption of the new military doctrine. Following a violent coup within Grenada's leftist government, the Reagan administration seized

the opportunity to return Grenada to the fold of capitalism by sending an invasion force of 6,000 US troops to storm the island. Grenadian troops outnumbered, outgunned and demoralized by the recent coup offered little resistance. "With the equipment we have it's like Star Wars fighting cavemen," said one soldier.¹ Three days after the troops landed, the fighting was essentially over.

Unlike the invasion of Normandy Beach during World War II, the invasion of Grenada took place without the presence of journalists to observe the action. Reagan advisors Mike Deaver and Craig Fuller had previously worked for the Hammill Company, a PR firm which had represented the Guatemala government to squelch negative publicity about Guatemala's massive violence against its civilian population. Following their advice, Reagan ordered a complete press blackout surrounding the Grenada invasion. By the time reporters were allowed on the scene, soldiers were engaged in "mop up" actions, and the American public was treated to an antiseptic military victory minus any scenes of killing, destruction or incompetence. In fact, as former army intelligence officers Richard Crabbie and Paul Savage wrote a year later in the *Boston Globe*, "What really happened in Grenada was a case study in military incompetence and poor execution." Of the 18 American servicemen killed during the operation, 14 died in friendly fire or in accidents. To this day, no one has been able to offer a reliable estimate of the number of Grenadians killed. Retired Vice Admiral Joseph Metcalf III remembered the Grenada invasion fondly as "a marvelous, sterile operation."²

After reporters protested the news blackout, the government proposed creating a "National Media Pool." In future wars, a rotating group of regular Pentagon correspondents would be on-call to depart at a moment's notice for US surprise military operations. In theory, the pool system was designed to keep journalists safe and to provide them with timely, inside access to military operations. In practice, it was a classic example of PR crisis management strategy, enabling the military to take the initiative in controlling media coverage by channeling reporters' movements through the government-designated sources.³

The first test of this "pool system" came on December 20, 1989, when President Bush sent US troops into Panama to oust General Manuel Noriega. Until his fall from official grace earlier that year, Noriega had been a longtime informant for the CIA and US Drug Enforcement Agency. As vice president, in fact, Bush himself had personally honored Noriega for his assistance to US antidrug efforts.

For that reason alone, the invasion of Panama required careful management to keep the media from raising embarrassing questions.

Once again, the invasion was carried out with blinding speed. The Pentagon held the National Media Pool captive on a US base in Panama for the first five hours of the fighting, by which time the heaviest action was already over. Outside of Pentagon pictures spoon-fed to journalists, little real information reached the American public. In El Chorrillo, the desperately poor neighborhood in Panama City where General Manuel Noriega's headquarters were located, at least 300 civilians died in the attack and resulting crossfire—some burned alive in their homes. Aside from the victims and US Army tank crews, however, no one was allowed to observe the attack. The media dutifully reported the Pentagon's claim that only 202 civilians and 50 Panamanian soldiers died in the entire invasion, even though estimates from other sources ranged as high as 1,000 civilian deaths.²³

Dirty Little Wars

Central America's revolutionary movements were too strong to be dislodged with a weekend war like the ones in Grenada and Panama. A longer-term, more sophisticated strategy was needed—one that kept US troops out of the line of fire while enabling the Pentagon to confront the enemy. The strategy that earned the day in Washington became known as the doctrine of low-intensity conflict. As Siria Mies observed in her landmark 1986 analysis:

Its name comes from its place on the intensity spectrum of warfare which ascends from civil disorders through classical wars to nuclear holocaust.... This kind of conflict is more recent. It was described in 1972 by Major General Walter W. Wright, commander-in-chief of the Army's Seventh Special Forces. He warns that the term "low-intensity" is misleading, as it obscures the level of violence strictly from a military viewpoint. In fact, Wright argues, this type of conflict involves political, economic, and psychological warfare, with the military being a distinct but far from only cause. In perhaps the most lucid definition given by a US officer, Wright concludes that "we can't win a total war at the grassroots level."²⁴

The 1979 Sandinista revolution which overthrew the Somoza dictatorship in Nicaragua ringed alarm bells in Washington. The Somoza family had ruled the country for 45 years after coming to power by murdering its enemies. It was notorious for corruption and violence, but it was also considered an unwavering ally of the United States.

Anastasio Somoza was also one of the first Latin American dictators to recognize the value of a good flack, hiring the Mackenzie and McCheyne PR firm in New York along with lobbyist William Cramer, a former Republican congressman from Florida. In 1978 Somoza's last full year in power, Mackenzie and McCheyne received over \$500,000 in fees from the Somoza government. As the revolution gained momentum, Mackenzie and McCheyne partner Ian Mackenzie was despatched to counter negative reports characterizing the dictator as corrupt, authoritarian, crude, cruel and overweight.

"The president is totally different from what people think," Mackenzie said. "He is intelligent, most capable, warm hearted. He is loyal and strong with his friends, compassionate with his enemies.... By the sheer law of averages, Somoza has to have done some good. Even Mussolini did some good for Italy." As an example of the freedom that existed under the Somoza regime, Mackenzie pointed to Nicaragua's opposition newspaper, *La Prensa*.¹⁵

Two months later, *La Prensa* editor Pedro Joaquin Chamorro was gunned down in the street by Somoza's business partners, triggering a paralyzing nationwide strike demanding Somoza's resignation. Somoza hired a new flack, paying \$7,000 per month for the services of Norman L. Wolfson of the New York PR firm of Norman Lawrence Patterson & Fenell. As Somoza's air force was decimating Nicaraguan cities with aerial bombings during its final campaign of terror, Wolfson— who didn't speak Spanish—complained to whoever would listen that reporters were trying to "knock down" Somoza and had not been interviewed.¹⁶ (Wolfson's memoir of his experience titled *Selling Somoza: The Lost Cause of a PR Man*—appeared in the July 26, 1979 issue of William Buckley's conservative *National Review*, which was on sale at newsstands on July 19, the day Somoza fled the country. In it, Wolfson describes his client as "a spoilt brat who had evolved into middle age, I know it all who asked for advice and couldn't take it, a boor, a rude, overbearing bully, who fantasized about crushing the gentility of journalists.")

By the time Somoza fled Nicaragua, his family had accumulated wealth estimated at \$100 to \$500 million. Meanwhile, half the country's population was illiterate. One in three infants born to poor Nicaraguans died before the age of one. More than 20,000 Nicaraguans suffered from active incurable tuberculosis. The victorious Sandinistas launched popular popular vaccination and education programs. They also broke new ground in foreign policy, seeking alliances with Cuba and the Soviet Union. A line in the country's

new national anthem—We fight the yankees, enemies of humanity—showed just how far they intended to take Nicaragua from the Somoza days of dependence and fealty to the United States.

The low-intensity strategy aimed at undermining the Sandinistas was an ambitious concept uniting Vietnam-era counterinsurgency with civic action initiatives, psychological warfare, public relations activities and civilian development assistance projects traditionally considered beyond the sphere of military responsibilities. On the economic level, the US pressured international financial institutions to cut off loans to Nicaragua and imposed a debilitating trade embargo. On the political front, the US promoted carefully stage-managed elections in El Salvador and Honduras. Psychological operations against Nicaragua ranged from sabotage attacks to radio propaganda broadcasts. On the military level, US strategy was designed to avoid the commitment of US ground troops while doing everything possible to create the *fear* of a US invasion.

The US also brought together Somoza's dispersed National Guard and reorganized it into what became known as the *contras*. At first the *contras* had no political leadership, so the White House recruited a group of disaffected Nicaraguan businessmen and scripted speeches to help them pose as the *contras'* civilian leadership. The civilian leaders included Edgar Chamorro, a Nicaraguan advertising executive who later became disaffected with the cause. Chamorro complained bitterly in his 1987 book, *Packaging the Contras: A Case of CIA Disinformation*, that the US had used him as a civilian figurehead for an army over which he had no real control.

The CIA paid Chamorro a salary of \$2,000 per month, plus expenses for his work, which included bringing Honduran journalists and broadcasters to write and speak favorably about the *contras* and to attack the Nicaraguan government and call for its overthrow.

Approximately 15 Honduran journalists and broadcasters were on the CIA's payroll, and our influence was thereby extended to every major Honduran newspaper and radio and television station, Chamorro said.²⁰

In 1983 the Reagan Administration began a series of major military maneuvers in Honduras, coordinated with *contras* units and the Salvadoran military. The maneuvers were carefully staged to create the impression that they were preludes to a US invasion of Nicaragua. In reality, as Miles observed,

²⁰ The maneuvers were not a preparation or cover for the war. *The Return of the Conquistador: The Reinvention of the War*. —[Editor's note: The Administration may be

the bombing of towns have been an integral part of the plan at the psychological level. The first goal was to seize the economy by forcing a massive diversion of resources into defense. Next came psychological operations to feed on the conflict. Just as the country urged Nicaraguan youths to escape the torture in Marxist drift, ride-sessions of the Nicaraguan Defense Force (FDN) or Hondurans urge a revolt against the communists who spend so much time in bullet holes instead of food.¹⁸

The Reagan administration faced a scandal in 1983 with the disclosure that the CIA had produced a training manual for the classified *Psychological Operations in Guerrilla Warfare*. The strategy outlined in the text include recommendations for selective assassination of Nicaraguan government officials. Critics charged the CIA with encouraging indiscriminate assassination of civilians. Mies observed however that the actual intent of the document was more subtle:

There was a serious effort to reduce the presence of the existing government by renewing successive bombing programs and the introduction of other terror as well as them... To practice this means the targeted torture and assassination of others, health workers, communication media and the revolutionaries in the community. This is not as many other efforts to discredit or evidence against civilians... Rather, the evidence is part of a broad and systematic policy that reflects the changing pattern of the war.¹⁹

The War At Home

The most pressing concern of all for the Reagan administration was the need to win the support of the US people for its policies in Central America. It took the most critical specie operation mission we have today is to persuade the American people that the communists are out to get us. If we can win this war of ideas we can win everywhere else explained Michael Kelly, Deputy Assistant Secretary of the US Air Force. Psychological operations ranging from public affairs on the one end through black propaganda on the other end is the advertising and marketing of our product.

Public Affairs is the government's term for public relations, rather pointedly change of terminology adopted to get around the 1973 law which specifically enjoins federal government agencies from engaging in public relations activities. The law also forbids the White House from sending telegrams, letters, printed matter or other media outside official channels to influence members of Congress regarding legislation. Rules against CIA involvement in

domestic US politics are even more severe. It is against the law for the CIA to operate domestically—except in narrowly defined circumstances such as cooperating with an FBI investigation. In 1982 however, reports of the secret CIA war in Nicaragua led Congress to pass the Boland Amendment—ending military aid to the *contras* and barring the Reagan administration from any further attempts to overthrow the Sandinistas.

In response, Reagan dispatched CIA Director William Casey in January 1983 to set up a “public diplomacy” machine that journalists Robert Parry and Peter Kornbluh describe as “America’s first peacetime propaganda ministry”—a set of domestic political operations comparable to what the CIA conducts against hostile forces abroad. Only this time they were turned against the three key institutions of American democracy—Congress, the press, and an informed electorate. Employing the scientific methods of modern public relations and the war tested techniques of psychological operations, the administration built an unprecedented bureaucracy in the National Security Council and the State Department designed to keep the news media in line and to restrict conflicting information from reaching the American public.⁵²

As head of the operation, Casey appointed Walter Raymond Jr., a 20-year veteran of the CIA’s clandestine overseas media operations—described by one US government source as the CIA’s leading propaganda expert. According to *Washington Post* editor Ben Bradlee, Raymond’s involvement in the campaign symbolized “the wholesale integration of intelligence and PR at the National Security Council.” During the Iran-Contra scandal, Congress investigated the Reagan administration’s domestic propaganda operations and found that Raymond’s name appeared on Oliver North’s calendar more than that of any other White House staff member or government employee. A chapter detailing these domestic activities was drafted for the investigating committee’s Iran-Contra report, but House and Senate Republicans successfully blocked even a paragraph of the draft from being included in the committee’s final report. As a result, the CIA’s domestic propaganda activities in violation of its charter have received almost no public scrutiny.

A Little Help from Our Friends

As the PR apparatus was taking shape in August 1983, Casey summoned a group of top public relations executives to a full-day hush-hush strategy meeting. Four of the five PR executives at the meeting

with Casey were prominent members of the Public Relations Society of America, the industry's leading professional association. All five were members of PR Seminar, a 37 year old highly secretive gathering of about 120 senior corporate PR executives. All PR Seminar proceedings are "off the record" and members are threatened with a lifetime ban if they reveal any details of PRS to the press. The members who met with Casey were:

- Kalman B. Druck, retired president and founder of Flarsig-Rotman & Druck. He was national president of the PRSA in 1972 and has long been one of its most outspoken and prominent members.
- Kenneth Clark, vice-president for corporate communications of Duke Power Co., and a former national treasurer of PRSA.
- Kenneth D. Heszen, senior vice-president of PR giant Burson-Märsteller, the largest PR firm in the world.
- William L. Greener Jr., senior vice-president of corporate relations at G.D. Searle. Greener had served previously as deputy press secretary for President Gerald Ford and then as assistant secretary of public affairs for the Department of Defense under Donald Rumsfeld in the late 1970s.
- James Bowring of Triple Morris, a highly experienced Washington lobbyist who later went on to work for Burson-Märsteller. In 1988 Bowring became chairman of the Public Affairs Council, the leading public affairs industry trade association.¹

According to Druck the atmosphere at the meeting was emotionally supercharged. It began in the morning with a briefing in front of a large map of Latin America. Aides from the CIA and National Security Council painted a frightening picture of subversives spreading throughout Central America and asked for advice to help pin white hats on the country and black hats on the Sandinistas. At theees' request, the PR executives brainstormed some ideas which were presented on a easel while Casey took copious notes.

The ideas boiled down to two general suggestions: first, that the administration follow the lead of modern day corporations by setting up a classic corporate communications function within the White House; second to dominate the *contracultura*, they proposed that the White House set up a private sector funded publication program funded by a prominent individual to run a highly publicized nation-wide drive.

Following this advice to the letter, the White House brought together a coalition of retired military men and right-wing millionaires to support the Nicaragua Freedom Fund — chaired by Wall Street investment executive William Simon. Contributors included familiar right wing figures like TV evangelist Pat Robertson, Colorado beer baron Joseph Coors, oil magnate Nelson Bunker Hunt, singer Pat Boone, and *Soldier of Fortune* magazine. The fund claimed to raise over \$20 million through activities such as a \$280-a-plate Nicaraguan refugee dinner in April 1985 attended by Casey and Simon and featuring a speech by Reagan. In reality the fund was a propaganda front spending almost as much money as it raised. An audit of the refugee dinner showed it had raised \$21,752 but costs totaled \$218,376, including \$116,938 in consulting fees.

The main purpose of the Nicaraguan Freedom Fund was to divert attention from the covert channels through which real money flowed to the *contras* in violation of the Boland Amendment. One of those channels was a specialized PR firm, International Business Communications, which pleaded guilty in 1987 to fraud by using a tax-exempt foundation to raise funds to arm the *contras*. It had been a profitable business according to the Iran-Contra congressional investigating committee which concluded that IBC had kept about \$1.7 million of the \$5 million it channeled to the *contras*.

The other part of the PR plan — setting up a communications function within the White House — put Raymond at the head of a newly created Office of Public Diplomacy for Latin America and the Caribbean. "Public diplomacy" was simply another synonym for public relations. In its first year alone, repeated Party and K-mob hit the activities of the OPP included: booking more than 1,500 speaking engagements, including radio, television and editorial board interviews; publishing three booklets on Nicaragua; and distributing materials to 1,000 college libraries, 520 political science faculties, 142 editorial writers and 107 religious organizations. Special attention was given to prominent journalists.⁷² In 1985, for example, a memo by OPP staffer Otto Reich described using a "cat out" (someone whose tie to the OPP was concealed) to set up visits by *contras* like Alonso Robleto to news organizations including Hearst Newspapers, Newswatch Scraps Howard Newspapers, the editorial board of the *Washington Post*, USA Today, CNN, the MacNeil Lehrer Report, the *Today Show*, and CBS Morning News.⁷³

In private memos to the National Security Council, the OJD boasted about having "killed" news stories that contradicted the

Reagan administration's public position on Nicaragua using tactics that included intimidation and character assassination of journalists. Using \$100,000 raised from private donors, the OPD funded organizations such as Accuracy In Media, a right-wing organization that vigorously attacked journalists who criticized Reagan's foreign policy. In July 1985, the OPD itself helped spread a scurrilous story that some American reporters had received sexual favors from Sandinista prostitutes in return for writing slanted stories.⁷

The OPD assigned five Army experts from the 4th Psychological Operations Group to find "exploitable themes and trends" and used opinion polling to "see what turns Americans against Sandinistas." A variety of publicity stunts and news stories were staged to achieve this objective. In 1981, for example, the White House leaked information to the press to create a mythical "MIGs Crisis." The story, which claimed that Nicaragua was about to receive a delivery of Soviet fighter planes, was prominently played on the TV news with special bulletins interrupting regular programming. Although it was later proven false, the MIGs story helped create the public perception that Nicaragua posed a military threat to the US, and also diverted attention away from elections which had been held earlier that week in Nicaragua. Despite widespread praise from a large contingent of international observers, Nicaragua's first free elections—in which the Sandinistas received 67 percent of the vote—were summarily dismissed as a "sham" by the Reagan administration.

The White House used classic enemy image propaganda to paint the Sandinistas as the embodiment of evil—a second Cuba or second Libya—while describing the *contras* as the moral equivalent of our founding fathers. White House Communications Director Patrick Buchanan claimed that Iranian PLO, Libyan and Red Brigades elements were turning up in Managua and warned that if Central America goes the way of Nicaragua, they will be in San Diego. The Sandinistas were accused of drug trafficking, terrorism, persecuting Jews, building secret prisons, and beating Catholics in the street for attending mass.⁸

To push the terrorist charge, the White House used Neil Armstrongstone, a self-proclaimed expert on terrorism, and senior vice-president with the patriarchal law firm of Gray & Company. In fact, considerable circumstantial evidence suggests that Gray & Company was itself connected to secret arms and money supplies connected with the Iran-Contra affair.⁹ In addition to a web of laundering former transactions, the evidence includes the September 23, 1985

shooting of Glenn Souham in Paris. Souham was the son of New York PR counselor Gerard Souham, a frequent White House visitor whose firm was affiliated with Gray & Company. Glenn had talked openly to friends of working with a certain "lieutenant colonel" at the National Security Council and of suddenly making more money than ever before. Although the killing received almost no attention in the major news media, O'Dwyer's PR Service came to the conclusion that Young Souham, because of his international social and business connections, was enticed into Iran-Contra arms dealing, and that his indiscriminate bragging to friends led to his assassination.

The Smell of Success

By the late 1980s the Sandinistas' image in the United States was so negative that to describe Nicaragua as anything other than a totalitarian dungeon was considered cosmic sympathies. Reporters stationed in Nicaragua discovered that they had to trim their sails accordingly. In the first couple of years I was here, said Judy Butler, a journalist living in Managua, there was an interest, at least on the part of some reporters, to try to write about what they saw in Nicaragua within the framework of what would be acceptable to their editors. Increasingly, their stories were changed in the States and the reporters started carrying boxes around to show that what got published was not what they had written. Now they don't even bother.⁷⁶

The final nail in the Sandinista coffin was the National Endowment for Democracy (NED) founded by the same White House Executive Order that launched the Office of Public Diplomacy. Funded by Congress, the NED provides money for democracy promotion and civic training in foreign countries abroad. As Nicaragua geared up for elections in 1990, President Bush sent \$9 million in NED money, including a \$1 million contribution to the campaign of opposition presidential candidate Violetta Chamorro.

Bush almost needn't have bothered. By 1990 a decade of war combined with the US blockade of trade and investment had reduced Nicaragua to a bleeding hell hole. Economists debated whether "shattered" was a strong enough word to describe the state of the Nicaraguan economy, which suffered an inflation rate of 200,000 percent in 1988. To curb inflation, the Sandinistas had adopted a series of drastic economic measures, driving up unemployment and starving free food and health programs to the poor. The unpopular military draft rationing and a general feeling of

exhaustion all contributed to the Sandinistas' growing unpopularity and the Chamorro opposition won the elections handily.

In the United States, revelations of White House Iran-Contra operations brought congressional investigations, lawsuits and convictions which were later overturned. The Office of Public Diplomacy was disbanded in 1988 after the US Comptroller General concluded that it had engaged in prohibited covert propaganda activities designed to influence the media and public to support Administration Latin American policies.⁷⁶

The PR officials involved in helping Casey design the plan also came under scrutiny when another member of the Public Relations Society of America, Summer Harrison, filed a complaint with the PRSA's Ethics Board. Under PRSA's code of ethics, members are supposed to strictly adhere to government rules. After meeting to assess Harrison's charges, however, the Ethics Board issued a terse announcement stating that its members had not violated the code and that there was no basis for further examination. Harrison complained about improprieties and conflicts of interest in the ethical review process. In response the committee took up charges against Harrison claiming that her complaint had violated a provision of the ethics code which says PRSA members may not "intentionally damage the professional reputation or practice of another practitioner." Rather than answer the charge, Harrison resigned in disgust from the PRSA.⁷⁷

The Mother of All Clients

On August 2, 1990, Iraqi troops led by dictator Saddam Hussein invaded the oil-producing nation of Kuwait. Like Noriega in Panama, Hussein had been a US ally for nearly a decade. From 1980 to 1989 he had killed about 150,000 Iranians in addition to at least 13,000 of his own citizens. Despite complaints from international human rights groups, however, the Reagan and Bush administrations had treated Hussein as a valuable ally in the US confrontation with Iran. As late as July 25 – a week before the invasion of Kuwait – US Ambassador April Glaspie committed with Hussein over a cheap and un-airable profile by ABC's Diane Sawyer and wished for an appearance in the media – even for five minutes – by Hussein that would help explain Iraq to the American people.

Glaspie's chosen comments may have helped convince the dictator that Washington would look the other way if he annexed a neighboring kingdom. The invasion of Kuwait, however, crossed

a line that the Bush Administration could not tolerate. This time Hussein's crime was far more serious than simply gassing to death another brood of Kurdish refugees. This time oil was at stake.

Viewed in strictly moral terms, Kuwait hardly looked like the sort of country that deserved defending, even from a monster like Hussein. The tiny but super-rich state had been an independent nation for just a quarter century when in 1986 the ruling al-Sabah family tightened its dictatorial grip over the black gold it took by disbanding the token National Assembly and firmly establishing all power in the bejeweled hands of the ruling Emir. Then, as now, Kuwait's ruling oligarchy brutally suppressed the country's small democracy movement, intimidated and censored journalists, and hired desperate foreigners to supply most of the nation's physical labor under conditions of indentured servitude and near-slavery. The wealthy young men of Kuwait's ruling class were known as spoiled party boys in university cities and national capitals from Cairo to Washington.²⁰

Unlike Grenada and Panama, Iraq had a substantial army that could not be subdued in a mere weekend of fighting. Unlike the Sandinistas in Nicaragua, Hussein was too far away from US soil to rich with oil money, and too experienced in riding through propaganda and terror to be dislodged through the psychological warfare techniques of low-intensity conflict. Waging a war to push Iraq's invading army from Kuwait would cost billions of dollars and require an unprecedented massive US military mobilization. The American public was notoriously reluctant to send its young into foreign battles on behalf of any cause. Seizing war in the Middle East to the American people would not be easy. Bush would need to convince Americans that former ally Saddam Hussein now embodied evil, and that the oil fieldsm of Kuwait was a struggling young democracy. How could the Bush Administration build US support for liberating a country so fundamentally opposed to democratic values? How could the war appear noble and necessary rather than a crass grab to save cheap oil?

"If and when a shooting war starts, reporters will begin to wonder why American soldiers are dying for oil-rich sheiks," warned Hal Steward, a retired army PR official. "The US military had better get cracking to come up with a public relations plan that will supply the answers the public can accept."

Steward needn't have worried. A PR plan was already in place paid for almost entirely by the oil-rich sheiks themselves.

Packaging the Emir

US Congressman Jimmy Haves of Louisiana—a conservative Democrat who supported the Gulf War—later estimated that the government of Kuwait funded as many as 20 PR law and lobby firms in its campaign to mobilize US opinion and force against Hussein.⁷ Participating firms included the Rendon Group, which received a retainer of \$100,000 per month for media work and Neill & Co which received \$50,000 per month for lobbying Congress. Sam Zakhem, a former US ambassador to the oil-rich gulf state of Bahrain funneled \$7.7 million in advertising and lobbying dollars through two front groups—the "Coalition for Americans at Risk" and the "Freedom Task Force." The Coalition—which began in the 1980s as a front for the contras in Nicaragua prepared and placed TV and newspaper ads and kept a stable of fifty speakers available for pro-war rallies and publicity events.⁸

Hill & Knowlton, then the world's largest PR firm, served as mastermind for the Kuwaiti campaign. Its activities alone would have constituted the largest foreign funded campaign ever aimed at manipulating American public opinion. By law, the Foreign Agents Registration Act should have exposed this propaganda campaign to the American people—but the Justice Department chose not to enforce it. Nine days after Saddam's army marched into Kuwait, the Emir's government agreed to fund a contract under which Hill & Knowlton would represent "Citizens for a Free Kuwait," a classic PR front group designed to hide the real role of the Kuwaiti government and its collusion with the Bush administration. Over the next six months, the Kuwaiti government channeled \$11.9 million dollars to Citizens for a Free Kuwait, whose only other funding totalled \$17,801 from 78 individuals. Virtually all of CFK's budget—\$10.8 million—went to Hill & Knowlton in the form of fees.⁹

The man running Hill & Knowlton's Washington office was Craig Fuller, one of Bush's closest friends and inside political advisors. The news media never bothered to examine Fuller's role—until after the war had ended—but if America's editors had read the PR trade press they might have noticed this announcement published in *O'Donnell's PR Services* before the fighting began: Craig L. Fuller, chief of staff to Bush when he was vice president, has been on the Kuwaiti account at Hill & Knowlton since the first day. He and Bob Dierschneider at one point made a trip to Saudi Arabia—observing the production of some 20 videocassettes among other chores. The Within Group research arm of H&K was the pollster for the Reagan

for a Free Kuwait also capitalized on the publication of a quickie 15-page book about Iraqi atrocities titled *The Rape of Kuwait*, copies of which were stuffed into media kits and then featured on TV talk shows and the *Wall Street Journal*. The Kuwaiti embassy also bought 200,000 copies of the book for distribution to American troops.

Hill & Knowlton produced dozens of video news releases at a cost of well over half a million dollars, but it was money well spent resulting in tens of millions of dollars worth of free air time. The VNRs were shown by eager TV news directors around the world who rarely (if ever) identified Kuwait's PR firm as the source of the footage and stories. TV stations and networks simply fed the carefully crafted propaganda to unwitting viewers, who assumed they were watching real journalism. After the war Arthur Rouse asked Hill & Knowlton to show him some of the VNRs, but the PR company refused. Obviously the phony TV news reports had served their purpose—and it would do H&K no good to help a reporter reveal the extent of the deception. In *Unreliable Sources* authors Martin Lee and Norman Solomon noted that 'when a research team from the communications department of the University of Massachusetts surveyed public opinion and correlated it with knowledge of basic facts about US policy in the region they drew some sobering conclusions. The more television people watched, the fewer facts they knew, and the less people knew in terms of basic facts, the more likely they were to back the Bush administration.'

Throughout the campaign the Within Group conducted daily opinion polls to keep Hill & Knowlton take the emotional pulse of key constituencies so it could identify the themes and slogans that would be most effective in promoting support for US military action. After the war ended, the Cetradim Broadcasting Corporation produced an Emmy award-winning TV documentary on the PR campaign titled 'To Set a War'. The show featured an interview with Worldwide executive Doc Alsop in which Alsop bragged of his work and demonstrated how audience surveys were even used to physically adapt the clothing and hairstyle of the Kuwait ambassador so he would seem more likable to TV audiences. Within's job, Alsop explained, was to identify the messages that really resonate emotionally with the American people. The theme that struck the deepest chord of the crowd they discovered, was the fact that Saddam Hussein was a madman who had committed atrocities even against his own people and had tremendous power to do further damage and he needed to be stopped.

Throughout the campaign the Winkler Group conducted daily opinion polls to keep Hill & Knowlton take the emotional pulse of key constituencies so it could identify the themes and slogans that would be most effective in promoting support for US military action. After the war ended, the Canadian Broadcasting Corporation produced an Emmy award-winning TV documentary on the PR campaign titled 'To See a War'. The show featured an interview with Winkler executive Dee Alsop in which Alsop bragged of his work and demonstrated how audience surveys were even used to playfully adapt the clothing and hairstyle of the Kuwaiti ambassador so he would seem more likable to TV audiences. Within such Alsop explored was 'to identify the messages that really resonate emotionally with the American people'. The theme that struck the deepest emotional chord they discovered was the fact that Saddam Hussein was a madman who had committed atrocities even against his own people, and had tremendous power to do further damage and he needed to be stopped.'

Suffer the Little Children

Every big media event needs what journalists and flacks alike refer to as "the hook." An ideal hook becomes the central element of a story that makes it newsworthy, evokes a strong emotional response and sticks in the memory. In the case of the Gulf War the "hook" was invented by Hill & Knowlton. In style, substance and mode of delivery it bore an uncanny resemblance to England's World War I hearings that accused German soldiers of killing babies.

On October 10, 1990, the Congressional Human Rights Caucus held a hearing on Capitol Hill which provided the first opportunity for formal presentations of Iraqi human rights violations. Outwardly the hearing resembled an official congressional proceeding, but appearances were deceiving. In reality the Human Rights Caucus, chaired by California Democrat Tom Lantos and Illinois Republican John Porter, was simply an association of politicians. Lantos and Porter were also co-chairs of the Congressional Human Rights Foundation, a legally separate entity that occupied free office space valued at \$3,000 a year in Hill & Knowlton's Washington, DC, office. Notwithstanding its congressional trappings, the Congressional Human Rights Caucus served as another Hill & Knowlton front group which—like all front groups—used a noble sounding name to disguise its true purpose.¹⁴

Only a few astute observers noticed the hypocrisy in Hill & Knowlton's use of the term "human rights." One of those observers was John MacArthur, author of *The Second Front*, which remains the best book written about the manipulation of the news media during the Gulf War. In the fall of 1990, MacArthur reported, Hill & Knowlton's Washington switchboard was simultaneously fielding calls for the Human Rights Foundation and for "government representatives of Indonesia," another H&K client like H&K client Turkey. Indonesia is a practitioner of naked aggression, having seized—the former Portuguese colony of East Timor in 1975. Since the annexation of East Timor, the Indonesian government has killed, by conservative estimate, about 100,000 inhabitants of the region.¹⁵

MacArthur also noticed another telling detail about the October 1990 hearings. The Human Rights Caucus is not a committee of congress, and therefore it is unencumbered by the legal accouterments that would make a witness hesitate before he or she lied.

Lying under oath in front of a congressional committee is a crime; lying from under the cover of anonymity to citizens is merely public relations.¹⁶

In fact, the most emotionally moving testimony on October 11 came from a 15 year old Kuwaiti girl, known only by her first name of Nayirah. According to the Caucus, Nayirah's full name was being kept confidential to prevent Iraqi reprisals against her family in occupied Kuwait. Sobbing, she described what she had seen with her own eyes in a hospital in Kuwait City. Her written testimony was passed out in a media kit prepared by Citizens for a Free Kuwait. I volunteered at the al-Addam hospital, Nayirah said. While I was there, I saw the Iraqi soldiers come into the hospital with guns and go into the room where . . . babies were in incubators. They took the babies out of the incubators, took the incubators, and left the babies on the cold floor to die.⁷⁷

Three months passed between Nayirah's testimony and the start of the war. During those months, the story of babies torn from their incubators was repeated over and over again. President Bush told the story. It was recited as fact in Congressional testimony on TV and radio talk shows, and at the UN Security Council. Of all the accusations made against the dictator,⁷⁸ MacArthur observed none had more impact on American public opinion than the one about Iraqi soldiers removing 312 babies from their incubators and leaving them to die on the cold hospital floors of Kuwait City.⁷⁹

At the Human Rights Caucus however H&K and Knowlton and Congressman Lantos had failed to reveal that Nayirah was a member of the Kuwaiti Royal Family. Her father, in fact, was Saad Nizar al-Sabah, Kuwait's Ambassador to the US who sat listening in the hearing room during her testimony. The Caucus also failed to reveal that H&K vice-president Sam Fitz Pegedo had coached Nayirah in what even the Kuwaitis' own investigators later confirmed was false testimony.

If Nayirah's outrageous lie had been exposed at the time it was told, it might have at least caused some in Congress and the news media to soberly reevaluate the extent to which they were being skillfully manipulated to support military action. Public opinion was deeply divided on Bush's Gulf policy. As late as December 1990, a *New York Times/CBS News* poll indicated that 48 percent of the American people wanted Bush to wait before taking any action if Iraq failed to withdraw from Kuwait by Bush's January 15 deadline.⁸⁰ On January 12, the US Senate voted by a narrow five vote margin to support the Bush administration in a declaration of war. Given the narrowness of the vote, the babies thrown from incubators story may have turned the tide in Bush's favor.

Following the war, human rights investigators attempted to corroborate Navralsi's story and could find no witnesses or other evidence to support it. Amnesty International, which had fallen for the story, was forced to issue an embarrassing retraction. Navralsi herself was unavailable for comment. This is the first allegation I've had that she was the ambassador's daughter," said Human Rights Caucus co-chair John Porter. "Yes, I think people ... were entitled to know the source of her testimony." When journalists for the Canadian Broadcasting Corporation asked Nisir al-Sabah for permission to question Navralsi about her story, the ambassador angrily refused.²⁸

Front-line Flacks

The military buildup in the Persian Gulf began by flying and shipping hundreds of thousands of US troops, instruments, and supplies to staging areas in Saudi Arabia, yet another nation with no tolerance for a free press, democratic rights, and most western customs. In a secret strategy memo, the Pentagon outlined a tightly woven plan to constrain and control journalists. A massive babysitting operation would ensure that no truly independent or uncensored reporting reached back to the US public. News media representatives will be escorted at all times, the memo stated. Repeat at all times.

Deputy Secretary of Defense for Public Affairs Pete Williams served as the Pentagon's stop-flack for the Gulf War. Using the proven PR strategy of good cop/bad cop, the government of Saudi Arabia played the heavy, denying visas and access to the US press while Williams the reporter friend appealed to int'l media repeatedly on their behalf. This strategy kept news organizations competing with each other for favors from Williams and kept them from questioning the fundamental fact that journalistic independence was impossible under military escort and censorship.

The overwhelming technological superiority of US forces won a decisive victory in the brief and brutal war known as Desert Storm. Afterwards, some in the media quickly admitted that they'd been manipulated to produce sanitized coverage which almost entirely ignored the war's human cost—today estimated at over 100,000 civilian deaths. The American public's single most lasting memory of the war will probably be the robotically successful videotests supplied by the Pentagon showing robot smart bombs striking on their intended military targets without even collateral damage.

Although influential media such as the *New York Times* and *Wall Street Journal* helped promote the version of the conflict with a

different picture began to emerge after the US stopped carpet bombing Iraq—note Lee and Solomon: “The pattern underscored what Napoleon meant when he said that it wasn’t necessary to completely suppress the news—it was sufficient to delay the news until it no longer mattered.”²⁰

Mexican Standoff

For Hill & Knowlton, the Kuwait account was a sorely needed cash cow, appearing at a time that the PR giant was suffering from low employee morale amid controversies surrounding some of its senior clients. When the Kuwaiti money dried up at the end of the war, Hill & Knowlton went into a precipitous decline. A series of layoffs and resignations at its Washington office—including a mass walkout of two dozen employees—reduced the staff from 250 to about 90. Clients began deserting the company, and rival PR firm Burson Marsteller stepped in to take its place as the world’s largest PR firm.

During the US debate over passage of the North American Free Trade Agreement (NAFTA), Burson Marsteller spearheaded a PR campaign for the government of Mexico that, in dollar terms, made Hill & Knowlton’s campaign for Kuwait look small by comparison. Mexican business interests and the country’s ruling Institutional Revolutionary Party (PRI) spent over \$50 million on PR and lobbying in the US alone to guarantee NAFTA’s passage.²¹ And these expenditures in turn were small change compared to the spending on spin control that went into the PRI’s dubious victory in Mexico’s 1994 elections. By the mid-1990s, advertising giant Young & Rubicam/Burson Marsteller’s parent corporation was raking in yearly Mexican revenues of over \$100 million. Analysts estimate that the PRI and its wealthy supporters spent well over \$1 billion toward the 1994 elections, compared to only \$30 million spent by its left-wing opposition. The money went not only to seduce voters, but also to reassure US and other foreign investors that 1994’s elections were clean and honest, in contrast to the blatant electoral frauds of the past, and that the investment climate in Mexico would remain favorable—the low wages, access to prime markets, no environmental restrictions, and prompt payment on the national debt.

To judge from the party line that prevailed in the US press during the early 1990s, Mexico was in the midst of an impressive economic renaissance—seemingly proving the wisdom of the country’s free market policies under president Carlos Salinas de Gortari. What the press missed, however, was the country’s growing social inequality,

Since the inauguration of Salinas in 1988, Mexico's 200 most powerful families had exponentially increased their wealth—thanks to lucrative government contracts, insider trading on Mexico's stock market, and bargain basement purchases of over 900 formerly state-owned enterprises. This transfer of public wealth into private hands created a country which in 1992 ranked fourth in the world in the number of billionaires—including extremely influential behind-the-scenes billionaire drug traffickers such as Carlo Fuentes with an estimated net worth of \$25 billion. (By way of comparison, the world's two "richest" men according to *Forbes* are William Gates with \$12.9 billion and Warren Buffett with \$10.7 billion.)

While the rich were growing richer, real wages for the majority of Mexicans plummeted in the 1980s and 1990s, and an increasing number of small farmers and Indians were forced to abandon their subsistence landholdings. As social scientists and government entities point out, this is the real reason why rebels, including members of the Zapatista Army of National Liberation, rose up against the Mexican government on New Year's day, the day that NAFTA went into effect. In the face of the Zapatista uprising, the facade of Mexico's "economic miracle" crumbled almost instantly. A series of other incidents contributed to the country's collapsing image. A Catholic Cardinal was killed by drug traffickers in the Guadalajara airport, apparently with collusion from police and government officials. Several billionaire businessmen were kidnapped for ransom of up to \$100 million. During the 1994 election campaign, an assassin killed Donaldo Coasico, the PRI's candidate for president, and opinion polls showed that the majority of the Mexican people believed the assassination was the work of the PRI itself. Later that summer, the head of the PRI was assassinated as well, in what investigative reporters said was an internal party feud. Responding to these events, foreign investment slumped and the peso was devalued. The Mexican elite began transferring billions of dollars out of the country.

Fix the Focus, Not the Problem

Throughout these crises, Burson-Marsteller and other Mexican and transnational PR firms demonstrated their effectiveness by working behind the scenes—swinging public opinion on ushering government and corporate leaders, swiping media coverage, and tailoring stories to the current situation. The stakes were high. Currently, 80% of Mexico's foreign investment comes from the U.S., to keep it's money flowing along with sufficient international loans to prevent Mexico

from defaulting on its \$150 billion foreign debt, investors demand guaranteed profits and political stability. Since real stability did not exist, Mexico's spin doctors worked to create the *image* of stability. As a Banson-Marssteller official in Mexico euphemistically put it, "our job is to build up the level of confidence of foreign investors to spotlight the positive economic developments in the country."

Banson-Marssteller's spin on the 1994 election was that the PRI—a notorious corrupt institution which has used force and fraud to rule Mexico without interruption for nearly 70 years—had reformed. This effort at spin control targeted in particular at international investors reached all the way into the Clinton White House. Nine days before the election, Banson-Marssteller sent Santiago Oñate, representing the Mexican Office of the President, met with several of President Clinton's closest advisers, including Cabinet Chief Leon Panetta and National Security Council Director Anthony Lake. At the end of the meeting, Clinton's advisers reassured Oñate that the White House didn't believe that there was "any crisis in Mexico, but rather just the normal anxiety that represents the transition to a competitive democracy." Meanwhile, the Mexican Businessmen's Council, another B-M client, was reassuring US investors that the PRI would carry on the elections—just as the polls indicated—and that Mexico's investment climate would remain stable. Back in Mexico City, another B-M client, the Secretary for Commerce and Industrial Development, worked to arrange a press conference featuring Indian leaders from Chiapas who denounced the Zapatista rebels as "violent radicals."⁷⁹

The elections were held on August 21, and as expected, the PRI swept the field, gaining the presidency and retaining overwhelming control over the national legislature. The US government and international press described the elections as the "cleanest in Mexico's history," ignoring widespread evidence of voter fraud, registration manipulation, intimidation, bribery, illegal financial donations, partisan misuse of government resources, distorted media coverage and misleading polling techniques. As in 1988, the PRI and government-appointed election officials refused to allow outside observers to compare computer tallies with the actual packets of marked ballots from the country's 90,000 voter precincts.

In the aftermath of the elections and a massive collapse of Mexico's inflated economy, civil unrest intensified, with street demonstrations, bus strikes, road blockades, seizures of city buildings and even armed conflict by leaders of the Zapatista guerrillas, known to

continue civil resistance until new democratic elections are held under a National Constituent Assembly.

To re-establish stability the Mexican army has apparently adopted a strategy of low-intensity conflict reminiscent of the wars of attrition that decimated Central America during the 1980s. This strategy has been studied by Global Exchange, an international organization which sponsors frequent delegations to Chiapas, the poverty-stricken department in southern Mexico where the Zapatista rebels remain entrenched. In June 1995, a delegation to southeastern Chiapas observed "large-scale deployment of troops in the areas of conflict; the systematic destruction of the means of community-based self-sufficiency; the creation of divisions through selective rewards and punishments; and the gradual dismantling of independent bases of community organization," tactics which appear to be governed by political, economic and psychological objectives.¹⁷

As the world moves toward the end of the twentieth century it seems to have solved many of its image problems but few of its real ones. Foreign policy planners have developed a frightening sophistication in their ability to combine military strategies with propaganda and psychological manipulation—but they have failed to eliminate starvation, disease, economic exploitation and violence—the root causes of international conflict. During the 1980s and early 1990s the United States seemingly won every war it waged, but the untamed uprising in Chiapas suggests that these wars may have been mere preliminary skirmishes in a broader war that we have been losing. The low-intensity conflicts in Nicaragua and El Salvador have given way to a new conflict in which the stakes are larger and the battles are closer to our own national borders. While U.S. planners remain obsessed with images and oblivious to the real human needs of the poor Latin America and the rest of the Third World will remain a hotbed of revolutionary ferment, fueled by the desperation of people for whom dying in battle appears preferable to dying of hunger. In a very real sense, the Third World War has already begun—but thanks to clever public relations, its major hasn't been announced.

CHAPTER ELEVEN

All the News That's Fit to Print

It's at the point where Bob Hume, the ABC correspondent at the White House, plays tennis with George Bush. Tom Feltman of the *New York Times* is very close to Dan Rather. You find these relationships in so close that reporters don't challenge the subjects of their stories. They just tell you what the government is saying. In other words, they have become story suppliers for power and not journalists.

JEFF COHEN

Executive Director, Fairness & Accuracy in Reporting (FAR)

If popular culture is any guide at all to the imagination of the American people there is something sacred about the news. Journalists along with private detectives and police seem to occupy a special place as the ministers of truth and wisdom in our society. The archetypal image for all three professions is the detective with the common touch—picture Gable, Bogart or PI Jim Meehan dressed in cheap clothes, cynical, smoking a cigar, fond of a drink at the local tavern, working odd hours, berating people, persistent, smart beneath that rumpled exterior, piecing together clues, finding contradictions, relentless and impulsive, refusing to let go of an investigation until the truth is exposed and the villains receive their just punishment. This image of the journalistic profession has been the backdrop for a number of popular plays, novels, films and television shows, including *Citizen Kane*, *This Is Our Life*, *Meet John Doe*, *The Front Page*, *The Paper* and *Murphy Brown*. Of course, mild mannered reporter Clark Kent is the alter ego of Superman, the ultimate comic book hero, who spends much of his time rescuing fellow reporters Lois Lane and Jerry Olsen when their journalistic curiosity gets them into trouble. Hollywood turned to real life in *All*

the President's Men—in which Robert Redford and Dustin Hoffman portray *Washington Post* reporters Bob Woodward and Carl Bernstein in their investigation of President Nixon's role in the Watergate scandal. The final scene of the movie visually dramatizes the power of the press when the camera zooms in on a clattering newsroom teletype as it prints out a sequence of bulletins from the Watergate affair culminating in the terse headline: **NIXON RESIGNS**.

Today—more than 20 years after Watergate—the saga of Woodward and Bernstein is related in high school textbooks as an example of the power of muckraking journalism. To perpetuate the mythology of the crusading press, many newspaper mastheads carry mottoes such as Thomas Jefferson's statement that "the only security of all is a free press." Americans grow up believing that the free press so cherished and constitutionally protected is a fierce watchdog of the public interest—and that when societal or political wrongs are spashed across page one of the *New York Times* or aired on *60 Minutes* our democratic system in some automatic way responds to fight the wrongs.

But schoolbooks often fail to mention that Woodward and Bernstein were virtually alone in their dogged pursuit of the Watergate scandal—which occurred in the midst of a presidential election yet had absolutely no impact on the election outcome. According to *Project Censored*, a phone call from the Nixon White House was all it took to persuade CBS chair William Paley to scale back Walter Cronkite's attempt to do an extraordinary two-part series about Watergate on the *CBS Evening News* before the election. Nixon was reelected by an overwhelming margin, and wasn't forced to resign until two years after the burglary. Even then the real heroes include a still unknown whistleblower dubbed "Deep Throat" and Nixon's own arrogance in leaving behind explosive loaded tape recordings of his self-incriminating involvement in cover-up. Even Woodward and Bernstein were never able to explain important aspects about the scandal, such as White House motivations behind the Watergate break-in or Deep Throat's reasons for coming forward.

Hard Pressed

The romantic mythology surrounding the cutthroat profession attracts many more would-be reporters than there are jobs available. In reality, as most working reporters readily admit, the profession is a far cry from its image: reporters are notoriously underpaid and overworked. While researching this book, we encountered one

reporter with a small town daily paper who was earning an annual income of \$13,000 in 1991 while working 60-hour weeks—less than he could have earned flipping hamburgers. Sitting below a poster of Rush Limbaugh which the newspaper management had mounted on the wall of his break room, the reporter described how the paper had ordered him and his fellow reporters to falsify time cards so it would appear they were only working 40 hours per week—thus enabling management to violate minimum wage laws. We contacted a state labor official who assured us that if the reporter kept good records, he could document the fraud and force the paper to pay him for his uncompensated labor. The reporter, however, was afraid that he would be fired if he filed a complaint, and we were left wondering: Is someone who collaborates this easily with covering up his own exploitation even capable of investigating and exposing the larger wrongs in his community?

In a democracy a free and independent press is counted upon to provide the information and opinions that fuel public debate, expose corruption, illuminate major social issues, and enable an informed citizenry to make participatory decisions. Today's reality, however, is ever more distant from this lofty ideal. Journalism is in fact in demise, and its collapse is opening ever more opportunities for PR practitioners to increase their influence in the news room.

To begin with, the media itself is a huge, profitable business, the domain of fewer and fewer giant transnational corporations. Modern technology and American economies have quietly created a new kind of "central authority over information," writes media critic Ben Bagdikian in *The Media Monopoly*, his landmark 1982 exposé. By the 1980s, the majority of all major American media—newspapers, magazines, radio, television, books, and movies—were controlled by fifty giant corporations. These corporations were interlocked in common financial interest with other massive industries and with a few dominant international banks. Bagdikian concedes that "There are other media voices outside the control of the dominant fifty corporations—but most are small and localized...their diminutive sounds tend to be drowned by the controlled thunder of half the media power of a great society."

When Bagdikian aped his book in 1993, he was elated to find that during the ensuing decade media concentration had increased so that fewer than 20 giant corporations owned over half of all media. When we interviewed him in August 1998, he said the situation is worsening so quickly and dramatically that it's hard

now to even get a number to compare. Suddenly there are big new players in the media business—super-giant corporations like Disney, Time Warner, AOL/Cable TV, and telephone companies. The ring-mingle of the players is increased by huge. Increasingly corporate giants and super-giants are working together in joint ventures. For instance, Turner is partly owned by Time Warner and AOL. Journalist news and public information have been integrated firmly into the highest levels of financial and non-financial corporate control. Conflicts of interest between the public's need for information and corporate desires for positive information have vastly increased.²²

"I generally agree with those who bemoan the decline of journalism for sensationalism and titillation," said Buck Donahue, a former newspaper editor who has worked for papers in Arkansas and Hawaii. "I blame at least part of this decline on the trend of large corporations to buy up both major and minor news media. Back in the good old days, most medium or small newspapers were owned by families, some of whom lovingly passed along their publications to the next generation. I worked for one such newspaper, the *Arkansas Gazette*, which at the time was the oldest newspaper west of the Mississippi. The pay was atrocious—\$85 a week in 1965—but the prestige of working for such a news organization more than made up for the small salary."

When corporations buy up a local paper, Donahue says, standards usually decline.

The writer went back to the journalists' workshop to quote the real Don Reynolds editor model as the guy that it all ties up—the one between the lines. Here's how these corporations work. After buying up several medium-sized newspaper with such tame, the companies take what losses can't be offset on the bottom line, or not interfere with the general extent of the publishing company's keep out editor. It may however they exert their own hand the editor rarely leaves that in that is to say if ever purchase. They cut the newspaper's staff to the minimum and takes a pocket full of pen and paper a day or week a less they stop printing every other article too printed the week I shot a pool table looks appropriate quotes they de-emphasize the news and emphasis advertising in order to compete.

Over the years or so you have it really strained a corporation. What comes off the editor's self is having so hard to set the paper at one is no time to be in death or lives negative reporting. Nevertheless, I think for super-giant corporations news

by press release. If they don't put hard pressed and bitter reporters resign themselves to covering the superficial and the easy—relying on press releases or on breaking, easy-to-cover stories such as the O.J. Simpson case. Reporters simply don't have the time and often a white (the inclination to do anything in depth.)

This environment may be demoralizing to journalists, but it offers a veritable hog's heaven to the public relations industry. In their 1985 book, *PR How the Public Relations Industry Writes the News*, authors Jeff & Marie Blyskal write that "PR people know how the press thinks. Thus they are able to tailor their publicity so that journalists will listen and cover it. As a result much of the news you read in newspapers and magazine or watch on television and hear on radio is heavily influenced and slanted by public relations people. Whole sections of the news are virtually owned by PR." Newspaper food pages are a PR man's paradise, as are the entertainment, automotive, real estate, home improvement and living sections. Unfortunately news hatched by a PR person and journalist working together looks much like real news dug up by enterprising journalists working independently. The public thus does not know which news stories and journalists are playing servant to PR.²

Today the number of PR flacks in the United States outnumbers working journalists, and the gap is widening. A working reporter is deluged daily with dozens if not hundreds of phone calls, letters, faxes and now e-mailed press releases. Pam Berns, the publisher of *Chicago Life* magazine, estimates that her office receives at least 100 PR contacts each and every day. "It's annoying and overwhelming," says Berns.³

PR Newswire claims to be "the world's acknowledged leader in the distribution of corporate, association and institutional information to the media and the financial community" for forty years. The firm has 19 offices in the US and distributes some 100,000 news releases a year to some 2,000 newsrooms for more than 15,000 clients. Other PR distribution services specialize in placing stories in news papers through the mass distribution of PR written feature articles and opinion pieces which are simply picked up as real news. The North American Press Syndicate, for example, sends camera-ready stories on behalf of most of the top PR firms and most Fortune 500 companies to 10,000 newspapers, almost all of whom reprint some of the material. The stories are designed to promote products or serve events political agendas. Lobbyists love it—create NAPS promotional material. You generate tons of letters to legislators.

A similar business, Radiot SA, supplies broadcast-quality news scripts to 500 radio stations throughout the country. "We write, typeset, print and distribute broadcast-quality scripts. We give you usage reports based on station verifications. And press radio journalists greet these canned scripts with relief rather than suspicion. When your job is to come up with hundreds of story ideas every month, Radiot SA helps," says Susan Vaughn, news director at KVTC in San Luis Obispo, California. Mary Kolbe, the news director at KKIN in Aitkin, MN, describes Radiot SA as "a lifesaver on a slow news day."

Even the media itself is getting into the PR distribution act. The Associated Press now makes money distributing electronically digitized PR photos to over 100 newspapers that have agreed to receive them. On June 26, 1991, for example, the *New York Times* ran a prominent article announcing that Federal Express had formally changed its name to FedEx—not exactly an earth-shattering expose. In fact, the story resulted from a PR campaign by FedEx. A photo accompanying the story showed a FedEx jet, and the photo credit simply read "Associated Press." Actually, Federal Express paid AP to electronically distribute the PR photo—which was staged and taken by the Federal Express company rather than an AP photographer.

Is It Real Or Is It Memorex?

The use of radio and video news releases is a little-known practice which took hold during the 1980s, when PR firms discovered that they could film, edit and produce their own news segments—entire programs—and that broadcasters would play the segments as news, often with no editing. When Gray & Company began producing a video program for its clients called "Washington Spotlight," the Mutual Radio Network came to Gray and asked to carry it. PR firms would not send out packaged radio and television stories. "No one was using them," notes author Susan Trento. "Not only technology, but economics made things easier for PR firms in the 1980s."

Video news releases, known as VNRs, typically come packaged with two versions of the story the PR firm is trying to promote. The first version is fully edited with voiceovers already included—or with a script indicating where the station's local news anchor should read his or her lines. The second version is known as "B-roll" and consists of the raw footage that was used to produce the fully edited version. The receiving station can edit the B-roll footage itself—or combine it with other footage received from other sources. There

are two economies at work here on the television side," explains a Gray & Company executive. "The big stations don't want prepackaged prepaged—they have the money, the budget, and the man power to put them together. But the smaller stations across the country cap up staff like this."

MediaLink, a PR firm that distributed about half of the 4,000 VNRs made available to newscasters in 1991, conducted a survey of 92 newsrooms and found that all 92 used VNRs supplied free by PR firms and subtly slanted to sell a client's products and ideas while appearing to be real TV news. On June 13, 1991, for example, the CBS *Evening News* ran a segment on the hazards of automatic safety belts. According to David Lieberman, author of a 1992 article titled "Fake News," the safety belt tape was part of a video news release created by — a lobby group largely supported by lawyers.

"VNRs are as much a public relations fixture as the print news release," stated George Gazer, a senior vice president of Hill & Knowlton. "In fact many public relations firms are well into the second generation of VNR technology. We use satellite transmissions from our own facilities almost on a daily basis, and wait eagerly for fiber optics systems to allow us to dial into nationwide networks."

With few exceptions, broadcasters as a group have refused to participate in any kinds of standards establishment for VNRs, in part because they rarely will admit to using them on the air. There are truly hundreds of examples of self-denial on the part of broadcasters when it comes to admitting that VNRs are used. Following a beverage company scare on the West Coast, for example, a VNR was mailed out to all three TV stations in the first city to report the problem. All three stations used the VNR in at least one newscast the following day, along with five other stations in the region. When asked later, however, all three stations denied that they had broadcast the material.¹¹

In 1985, Toronto reports, Gray & Company distributed a VNR featuring a censored interview with one of its clients, the ruthless King Hassan II of Morocco. The segments airing on CNN provoked a scandal with newscasters claiming they had been tricked into running paid propaganda. An executive at Gray & Company scoffed at the media's hypocrisy. "I used to read in *Broadcasting* the clientele letters from news directors after the story broke about electronic news releases saying, 'How despicable! Never in a thousand years!' And they were people I had talked to who had called me back so that they had the right coordinates on the satellite so that they could take the feed

They knew exactly who we were. They called us all the time. They asked us for stuff. They told us they couldn't get it. They forgot to turn their newlink on, and could we send them a hard copy FedEx overnight because they'd use it tomorrow night?

I was personally aggrieved at all this sort of self-gloatingness of the media when that story broke," said another Gray & Company executive. "They are free to use it. Not use it. I sent it for *Bird Watch* the crown scripts. Most of them take it straight off the air and broadcast it. Rip and read. Rip and read.

Watching the Detectives

In theory journalism is a watchdog profession which serves the public by finding and reporting on abuses of power. In practice reporters live under closer scrutiny than the people they are supposed to be monitoring.

Former *Wall Street Journal* reporter Dean Rothbart has carved a niche for himself within the PR industry by compiling dossiers on his former colleagues so that his corporate clients know how to manipulate individual members of the media. Rothbart's firm—called HER Products and Services—publishes this information in high-priced newsletters and delivers customized workshops and reports.

Rothbart told a 1995 meeting of the Public Relations Society of America that his workshops and newsletters help PR professionals know what a journalist is thinking. "One of the services we provide is taking biographies of reporters from all over the country—something like 1,000 bios—in our computer system—and if at any point you get a call from a journalist and don't know who it is, call up and we will fax you that bio within an hour."

These bios are a regular feature in a new Rothbart publication, the *HER Environmental News Reporter*. Promotional literature boasts that this \$995-a-year PR resource is tailored to serve the needs of communications professionals who deal with environmental issues. Let us be your eyes and ears when the environmental media converge... Gather vital information on key journalists... Who's the boss?... How do you break the ice?... Not only will you find news-journalists we'd tell you what they want from you and what strategies you can employ with them to generate more positive stories and better manage potentially negative situations.

The preview issue of Rothbart's newsletter includes a long piece on CNN's Environment Unit with biographies of all its top staff. It explains, for example, that Peter Dykstra worked for Greenpeace

for 11 years and attended Boston University's College of Communications. The issue also contains an interview with Linda Askan of the *Detroit Free Press*. The accompanying bio explains that Askan is president of the Society of Environmental Journalists and "enjoys all kinds of outdoor activities and tutors illiterate adults with Literacy Volunteers of America." In addition to this information, the story tells PR managers whom to contact if they want to complain about something that Askan writes. Chain of command: Reports to Bob Campbell, assistant city editor.¹⁶

Some PR firms specialize in tracking specific issues and compiling reports on the journalists writing stories. Rowan & Brewitt, a Washington, DC PR firm, conducted in-depth analyses for the dairy industry, analyzing media coverage of the rBGH issue to help answer these questions: Has the coverage been sensationalistic? Has the coverage favored the anti-rBGH views? How does the coverage of rBGH compare with the volume of coverage on Alar? Air emissions? Alaskan oil spills? Detailed charts and graphs examined virtually every story on rBGH over an extended period of time. Another media monitoring firm, CARMA International, also worked on the rBGH account and ranked individual reporters based on whether their stories were "favorable" or "unfavorable" to rBGH.¹⁷

The February 1995 issue of the newsletter *Environment Writer* reports on another PR effort to get inside the heads of journalists—laboratory research using 12 real journalists as paid guinea pigs to help develop a PR strategy for DuPont pesticides. DuPont flacks recruited participants by sending an invitation to selected members of the media, which promised: This learning endeavor will be used to help DuPont establish new policies regarding pesticides, their use and information important to consumers, the government, farmers and the press. Your ethics as a journalist (and that of your news organization) will not be violated or jeopardized in any way. The goal is to make better pesticide policies.

One participant who asked not to be named said: They would give us small pieces of paper which would say something like: DuPont makes very wonderful chemicals and no one needs to worry. Journalists were then told to develop a story line based on the information on the strip of paper while DuPont researchers observed from behind a mirrored window. When their work was done the reporters were handed envelopes that contained \$250 cash. I came out of there and I felt really disgusted that I had to com-

money in this kind of way,' said one journalist who participated in the study.²⁰

PR firms also hire real journalists to participate in training sessions so flacks can hone their skills in handling media situations. In *Sierra Magazine* reporter Dashka Slater describes her experience working for Robert J. Meyers and Associates, a Houston-based consulting firm that hired her and two other journalists to help ARCO Petroleum practice its PR plan for handling the news media following environmental disasters. In a staged run-through of an oil-spill, Slater and the other reporters were assigned to play the part of the 'predatory press.' Professional actors were brought in to play the part of environmentalists. ARCO employees and government officials played themselves. 'The drills give company flacks the opportunity to practice vanishing the truth fast in case the mop-up doesn't go as planned,' wrote Slater. Mostly the company and government spokespeople did what they had learned to do in numerous media training workshops: convey as little information as possible in as many words as possible. In the past 6 years Meyers and Associates have conducted more than 400 such training drills.²¹

A number of firms offer clipping and database services used to monitor the media. For a fee of \$1,000 per month, for example, organizations can subscribe to NEXIS/LEXIS which contains the full text of media stories appearing in a wide range of newspapers, magazines, newsletters and TV and radio programs. A skilled researcher can search for mention of a specific word and obtain articles from hundreds of publications. Clipping services are also available which charge a reading fee to provide virtually instant reports on stories appearing in the media which relate to clients' interest.

To monitor TV coverage, for example, Video Monitoring Services advertises that it records all news and public affairs programs on local TV stations in more than 130 markets, local radio stations in 14 markets and national broadcast TV, cable TV and radio networks. VMS also monitors stories in more than 20 countries including Australia, Canada, Germany, Israel and Japan. The company notifies its clients immediately which stories it has snagged off the airwaves that correspond to a list of keywords the client has provided. The keywords can be executives, company names, brand names, events, general or specific topics, etc. Such intelligence can assist PR firms in identifying sympathetic or cooperative reporters and editors, pressuring or punishing reporters who file unsympathetic stories, and measuring the impact of coverage upon public opinion.

Careful overnight telephone surveys can also help a corporation decide how—or even whether—to respond to a breaking story on a news program like *60 Minutes*. Before such instant surveys were available, a corporation exposed on national TV for crimes or corruption might feel compelled to immediately hold a news conference. Today, if overnight polling shows that the *60 Minutes* exposé had little impact on viewers, PR consultants advise their clients to simply ignore the report rather than risk drawing attention to it. Surveys can also reveal strategic approaches to crafting a response—perhaps the polling shows some sympathy for the corporation or other opinions that can be exploited in a carefully designed response the next day.

Experts Agree

The advertising industry learned years ago that one of the best ways to influence an audience is to put its message in the mouth of a publicly trusted expert such as a scientist, doctor or university professor. A whole genre of TV commercials has evolved featuring actors dressed in white laboratory coats who announce that research proves their brand is the best product on the market. The PR industry has also mastered the art of using third party experts—a ruse which almost never fails to hoodwink supposedly cynical reporters.

Via the internet, for example, public relations representatives assist the news media through an on-line service called Profnet based at the State University of New York in Stony Brook. Journalists in search of information are invited to simply e-mail their request to Profnet, which distributes it to over 800 PR representatives of research institutions in 16 countries. The flacks then find professors or researchers to answer the questions. Needless to say, this free information helps shape the spin of the story in a direction the PR representative is trying to promote.

Corporations also fund nonprofit research institutes which provide third party experts to advocate on their behalf. The American Council on Science and Health (ACSH), for example, is a commonly used industry front group that produces PR ammunition for the food processing and chemical industries. Headed by Elizabeth Whelan, ACSH frontingly represents itself as an independent, objective science institute. This claim was dissected by Howard Kurtz of the *Washington Post* in the March 1990 *Columbia Journalism Review*, which studied the special interests that fund ACSH. Kurtz reported that Whelan praises the nutritional virtues of fast food and receives

money from Burger King. She downplays the link between a high-fat diet and heart disease while receiving funding from Oscar Mayer, Frito-Lay, and Land O'Lakes. She defends saccharin and receives money from Coca-Cola, Pepsi, NutraSweet, and the National Soft Drink Association. Whelan attacks a Nebraska businessman's crusade against fatty tropical oils—the unhealthy oils in movie popcorn—while she is in the pay of palm oil special interests. "There has never been a case of ill health linked to the regulated, approved use of pesticides in this country," she claims, while taking money from a host of pesticide makers. And Whelan speaks harshly of mainstream environmentalists, such as the Natural Resources Defense Council. Speaking to the *Bangor Daily News*, Whelan described the NRDC as an ideologically fueled project whose target is the free-enterprise corporate America system. "I think they hate the word 'profit' and they'll do anything that will involve corporate confrontation."

Whelan defends her "scientific" views by saying that her findings have undergone "peer review" by experts among the scientists affiliated with her group. But Michael Jacobson of the Center for Science in the Public Interest dismisses the bona fides of such "peer review" scientists. "They don't exactly publish in leading scientific journals. They publish pamphlets that are reviewed by their professional cronies of the regulated industries. It's science that's forced through a sieve of conservative philosophy."

Journalists rarely check the background of sources so Whelan and the American Council on Science and Health are often quoted in the news as "scientific experts." For example in a show hosted by Walter Cronkite titled "Big Fears, Little Risks," Cronkite introduced Whelan as one of a growing number of scientists who fear that overstating the risk of environmental chemicals is actually threatening the health of Americans. In *Fortune* magazine Whelan appeared as the source in a story by Ann Reilly Dowd which stated: "A big part of the problem is that America's environmental policy making has increasingly been driven more by media hype and partisan politics than by sensible science." Despite the waves of panic that roll over America each year, some 500 scientists surveyed by the American Council on Science and Health have concluded that the threat to life from environmental hazards is negligible. Neither Cronkite nor Dowd explained that the ACSH is an industry front group.

Rhys Roth of the Northwest Atmosphere Protection Coalition consistently goes up against industry science as he tries to raise public concern about the greenhouse effect and ozone depletion. Roth says

scientists like Whelan—who speaks of the “allegedly depleting ozone layer”—are atmospheric confusionists who achieve their goal by simply sowing enough confusion in the minds of Americans about the science behind the greenhouse effect to defuse our collective concern and outrage, rendering us politically mute.

The Truth About Tumors

Whelan and other experts use creative manipulation of statistics to obscure the rising rate of cancer in industrialized nations. We also know there is no cancer epidemic, she says. Most cancer rates have been constant for decades. “What a marvelous time to live and to be born. We are giving ourselves and our children the gift of better and longer lives.”

This claim was repeated by David Shaw of the *Los Angeles Times* in a series of articles examining environmental health risks. Shaw took his information from Resources for the Future (RFF)—a pro-industry group that he described as a “think tank that specializes in environmental issues.” Shaw quoted RFF vice president Paul Portney: “If everything is as beautiful as we’re told, how come we’re healthier and living longer than ever before?” Shaw also turned to the National Cancer Institute, a government agency with close ties to the chemical and pharmaceutical industry. According to the Institute, the age-adjusted mortality rate for all cancers combined except lung cancer has been declining since 1950 except for those 85 and over.

These statistics, however, paint a misleading picture. Research by Samuel Epstein at the University of Illinois School of Public Health published in the *American Journal of Industrial Medicine* shows that the incidence of all types of cancer, excluding lung cancer, rose by 29.1 percent during the period from 1950 to 1988. Contrary to the National Cancer Institute’s claims, the British medical journal *Lancet* reported in 1990 that the death rate from breast and other cervical cancer systems cancers (breast cancer, multiple myeloma, kidney cancer, etc.) in Hodgkin’s lymphoma and mesothelioma has been increasing over the past 20 years in persons age 55 and older in the US and five other industrialized nations.²⁸

Improved medical care and a decline in cigarettes has kept cancer mortality rates from jumping dramatically. The extent to which mortality rates can obscure trends in the incidence of cancer is clearly a tragedy demonstrated by childhood cancer statistics, as stated in the David Steinman. According to the National Cancer Institute, deaths from childhood cancers decreased between 1950 and

1987. Yet between 1950 and 1988 the incidence of childhood cancers among whites increased 21.4 percent.¹¹

Notwithstanding the comforting assurances from industry front groups, most independent scientists recognize that cancer rates are increasing and that industrial chemicals play a critical role in this increase. The National Cancer Institute itself recognizes asbestos, benzene, arsenic, aromatic amines, coal tars, vinyl chloride, chromite and wood dust as carcinogens.¹² A growing body of scientific evidence links pesticides to escalating rates of certain kinds of cancer in farmers.¹³ We are just beginning to understand the full range of health effects resulting from the exposure to occupational and environmental agents and factors, admits a recent NCI report. Lack of appreciation of the potential hazards of environmental and food source contaminants and laws, policies and regulations protecting and promoting tobacco use, worsen the cancer problem and drive up health care costs.¹⁴

Revolving Doors

Media critics note that the media habitually fails to report on itself; it also fails to report on the PR industry. To do so would reveal the extent of its dependency on PR for access, sources, quotes, stories and ideas. According to authors Jeff and Marie Byska, "The press has grown frighteningly dependent on public relations people. Octopuses—the reading and viewing public—would have a hard time discovering this on their own because the dependence on PR is part of behind-the-scenes press functioning." Meanwhile, like an alcoholics who can't believe he has a drinking problem, members of the press are too close to their own addiction to PR to realize there is anything wrong. In fact, the press which has a seemingly inborn cynical, arrogant, down-the-nose view of public relations seems sadly self-deceptive about the true press/PR relationship.

Canned news and industry-supplied "experts" are effective because they appeal to budget-conscious news organizations. When a TV news show airs a video news release, the PR firm that produced the segment pays for all the costs of scripting, filming and editing. Likewise, PR-supplied experts enable reporters to produce authentic-sounding stories with a minimum of time and effort. The public rarely notices the self-serving bias that creeps into the news along with these subtle subsidies.

Sometimes the financial pressures that influence the news are more direct. In Canada, PR giant Burson-Marsteller's work for the

British Columbia timber industry became the subject of investigation by Ben Parfitt, forestry reporter for the daily *Vancouver Sun*. In 1981 however, Burson-Marsteller picked up the *Sun* as a client, and environmental policy shifted. Before Burson-Marsteller went to work for the *Sun*, the paper employed five full-time reporters to cover forestry, fisheries, native affairs, energy and mines, and environment. Today only the environment position remains, and the reporter on that beat has been instructed to cover environmental issues in Greater Vancouver and the lower mainland—an area which is conveniently distant from the Clayoquot Sound where Burson-Marsteller is helping to one of the last large areas of intact coastal temperate rainforest in the world.¹⁴

Parfitt sold an article to another publication, *The Georgia Straight*, that discussed Burson-Marsteller's past history—such as the company's PR work to clean up Argentina's international image at a time when the Argentinean military was murdering thousands of political dissidents. Parfitt also reported that Ken Rietz, a senior Burson-Marsteller employee and timber industry consultant, was a key Watergate conspirator. Following the publication of Parfitt's article, the *Sun* pulled him from the forest beat. "My personal experience in trying to cut through Burson-Marsteller was not greeted with favor by the paper," he says.¹⁵

Corporate advertisers have enormous power to influence news coverage, despite editors' statements to the contrary. Large corporations pump \$10 billion per year in advertising dollars into the coffers of the US media alone. Ben Bagdikian points out that selecting news in order to make advertising more effective is becoming so common that it has achieved the status of scientific precision and publishing wisdom. PR executive Robert Dilenser once admits that the notion that business and editorial decisions in the press and media are totally separate is largely a myth.

Mergers, buyouts and new electronic technologies are dismantling the crumbling firewall that's supposed to separate news reporting, advertising, and PR. Two of the largest global firms, Burson-Marsteller and Hill & Knowlton, are owned by two of the biggest advertising conglomerates, respectively Young & Rubicam and the WPP Group. These two PR/advertising goliaths purchase billions of dollars of media print space, TV and radio time. Their clients include Philip Morris, McDonald's, Ford Motor Company, Johnson & Johnson, AT&T, Pepsi, Coors, Goya, NutriSweet, Revlon, Reebok, and hundreds of other major advertisers.

In 1992 the nonprofit Center for the Study of Communication invited some 200 journalists to a Washington DC news conference where the Center released a report titled *Dictating Content: How Advertising Pressure Can corrupt a Free Press*. The scholarly report documented dozens of instances of media self-censorship imposed by advertisers and advertising related pressures. Almost none of the invited journalists came to the news conference and the report was virtually ignored in the news, prompting Project Censored - a media watchdog project at Sonoma State College to name *Dictating Content* as one of the ten best censored stories of 1992.

Corporations have found that one good way to stay friendly with the media is to court individual journalists who have become media celebrities - offering them huge sums of money for a brief appearance and fees. During the 1993-94 debate over health care reform the *National Journal* reported that drug companies and trade associations were "practically throwing money at journalists to get them to speak at their events." Media bigwigs including Fred Barnes of the *New Republic*, Eleanor Clift and Fred Bryant Quinn of *Newsweek*, Dr. Bob Aron of CBS and Dr. Art Urene of ABC collected speaking fees ranging up to \$25,000.⁸ More recently the *Political Gazette*, *Totem Reporter* noted in June 1995 that "Rep. Newt Gingrich Roberts accepted a \$5,000 fee for a speech last May to the Business League of Greater Fort Lauderdale that was subsidized by IBM." IBM, of course, is privately held \$12 billion company that distributes 1,000s of

Roberts refused to discuss her speaking fee. She feels strongly that it's not something that in any way shape or form she should be discussed in public. ABC spokeswoman Tileen Mapley said when *American Journalism Review* reporter Anne Stephan requested an interview:⁹

Most reporters, of course, never achieve the celebrity status that enables them to cash in on the speaking circuit. Corporate cut-governor and downsizing has brought headlines to the news media. Many journalists find themselves forced out of their chosen profession when they enter their thirties and find it difficult to support a family wage for retirement and family college for the kids. Some reporters create lesions. They see former schoolmates and colleagues leaving journalism to earn more money in politics or moves to the big law circuit or becoming another Woodward or Bernstein. Biggest book never mind authors. The revolving door continues to turn hand-to-city projected by the power base. This year's new American newspaper reporter is John Dilillo. This year

not only spins between the government and lobbies but between the press corps and the PR firms like Capitol Hill ladies who trade in their access and expertise for a lobbyist's scatty, burned-out or broke reporters can be tempted by the greener and more lucrative pastures offered by PR companies.⁷³

According to author Susan Trento, this revolving door—and the collaboration it fosters among elite groups in Washington—account for much of the gridlock in America's political process. Nothing seems to change. Nothing seems to get done. Nothing seems to get cleaned up. From Watergate to Koreagate to Debatag to the H.I.D. scandals to BCCI, it seems that the same people are doing the same things over and over and never getting punished—and no one seems to care. The triangle—the media, the government, and the lobbying and PR firms—protect each other.⁷⁴

The Information Superhypeway

The news media is presently undergoing a technological transformation as the information superhighway enters the mainstream of American culture. Its backbone—the internet began as a military communications system and evolved into an inexpensive, government-subsidized language of arcane computerese and loosely organized data on obscure academic topics ranging from bee migration patterns in Brazil to verb conjugation structures in Old Saxon. As computer technology brings a user-friendly version of the internet to a wider spectrum of users, it has become an object of intense corporate interest.

Hyped as the ultimate in electronic democracy, the information superhighway will supposedly offer a global cornucopia of programming, offering instant, inexpensive access to nearly infinite libraries of cultural material and entertainment. In some cases, the hype surrounding the information age has reached evangelical proportions, as its enthusiasts predict a revolution in every way of life, entwined with the new technologies of communication and serving to expand human freedom everywhere to create inevitably a "council of the people."⁷⁵

Other observers see darker possibilities on the horizon, and point out that since it hype surrounded the introduction of older media technologies such as the telephone, radio, and television. Given that a mere few corporations now control most media, media historian Robert McChesney writes that it is no surprise that the private sector with its immense resources has seized the initiative and is commercializing cyberspace at a spectacular rate, effectively trans-

turning it into a giant shopping mall. He predicts a flurry of competition followed by the establishment of a stable oligopoly dominated by a handful of enormous firms—a world of information lawns and lawns, thereby exacerbating our society's already considerable social and economic inequality.

PR firms are jumping on the online bandwagon, establishing worldwide web sites and using surveys and games to gather marketing and opinion information about the users of cyberspace, and developing new techniques to target and reach reporters and other online users.

The information superhighway is only one of the technologies enabling PR firms to reach audiences more directly and efficiently than ever before, writes Kay Hallinan in the Summer 1994 *Public Relations Quarterly*. Today, with many more options available, PR professionals are much less dependent upon mass media for publicity. In the decade ahead, the largest American corporations could underwrite entire sponsored channels. Organizations such as Procter & Gamble might be at vent packages together and subsidize programming that combines promotion and otherwise conducive messages—news talk shows, infomercials or sponsored entertainment or sports. Shows such as *Entertainment Tonight* stand to become the prototype for programming of tomorrow in which the sourceable is the deliverer of the message. Channel sponsors will be able to track coveted superheavy users with a highly targeted message over which they exert complete control.

Ironically, Hallinan worries that the growing interpenetration of news and advertising is troublesome because it weakens the credibility of the traditional news media. Every time that a newspaper places an ad within a news section that others have put pieces of paper over, he writes, "not every time, but every time that a television station presents an infomercial in the guise of programming, the larger questions change the value of their product." When news media can exclude a story in the part the television sponsor gained more than mere exposure, the direct product of close attention can become illegitimate. But legitimacy will be lost if the public comes to see a difference between news and paid propaganda. Who PR people might comment on the press is as likely we aren't going to want to do so all the time. Hallinan writes, "We can kill the goose that laid the golden egg. A loss of professionalism upon influence in the mass media could be devastating."

CHAPTER TWELVE

TAKING BACK YOUR OWN BACK YARD

The twentieth century has been characterized by three developments of great political importance: the growth of fascism, the growth of corporate power, and the growth of corporate propaganda as a means of protecting corporate power against democracy.

ALEX CAREY
Taking the Risk Out of Democracy

According to PR executive Pamela Whitney, "the key to winning anything is opposition research." At a PR seminar in December 1984 she illustrated the point by describing her company's undercover work for a corporate client who manufactures automobile antifreeze.

Common antifreeze is made of ethylene glycol, which sweetens and掩藏 its highly poisonous nature. As little as two or three spoons of antifreeze can cause death or blindness and every year it claims the lives of children and pets who drink it by accident. In Europe, antifreeze makers poison proof their products by adding bitterant—detonatium benzoate, listed in the *Guinness Book of World Records* as the most bitter substance ever discovered. A child, it is said, will make a face so wide that children almost always spit it out the instant it comes into their mouths.

In the United States, however, Whitney's company—Natural Grassroots and Communications Inc.—was hired to discredit an organization pushing for legislation to protect bitterant in antifreeze. We set up an operation where we poster is represented as the

estate of an older lady who had died and wanted to leave some a bit of money to an organization that helped both children and animals. Whitney said. We went in and met with this organization and said. We want to bequeath a hundred thousand dollars to an organization you're one of three that we are targeting to look at Give us all of your financial records Give us all of your tax-exemption records give us all of your game plan for the following year and the states you want to target and how you expect to win. We'll get back to you." "

Whitney grinned as she boasted. We got this information and found out she had let her tax-exempt IRS standing lapse which put her in not very good standing. Also we found out that her money came from surprise surprise the companies that make benzene. Without leaving my fingerprints or any traces we then got word through the media and killed the bill in all the states.

Whitney told this story before a crowded meeting of PR professionals. It drew no reaction from the rest of the audience — it shocked us. Although Whitney didn't mention the name of the organization she had spied on we decided to see if we could track it down. A computer search of news articles led us to the organization which in reality was just one won in an Oregon housewife named Lynn Tylezak who said she had started her "Pain in Project" after watching a public television documentary that described the use of denatonium benzoate in England where it was invented 20 years ago.

Tylezak laughed merrily when we told her the story we had heard from Pamela Whitney. She's got a very big accent Tylezak snorted. Her story has got more bells than a candlestick.

Tylezak said she was suspicious the moment Whitney's spy called claiming that he represented a Texas-based foundation called the Citizens Trust. In fact the sting operation was done secretly that included both Texas and Oregon state offices. After talking to them I sort of trust their game plan but still it hopefully convinced her not to waste lots of time and money.

Contrary to Whitney's claim that her PR firm killed the bill in the states where it was introduced Tylezak pointed out that a trapping ban in a freeze was passed by the Oregon state legislature in 1981 and went into effect in May of 1983. As far as I can tell there hasn't been anyone really pushing the issue so I don't know what's striking about when she says it was up for passage in other states Tylezak said. My god was I get it passed first in

Oregon and get the kinks worked out here before taking it to other states, and that has happened.⁴

And Lyczak took particular offense at Whitney's claim that her money came from the manufacturers of bitterant. I volunteered the last six years of my life hoping to prevent serious childhood poisonings, she said. I spent \$50,000 of our family savings on my cause—the bitterant manufacturers she cites donated exactly \$100 worth of photocopies and stamps, total. Another interested party donated the legal costs of starting a tax-exempt nonprofit—but I never used it, never organized members, never collected dues, never solicited contributions, never had a paid staff. Did Ms. Whitney know this? She should have. Her client deposed me and subpoenaed all of my personal and financial records almost six months before she gave her speech. Ironically, the only money I have ever received for my efforts was from the antifreeze companies in the form of a deposition fee and settlement. I donated all of this money to a charitable organization. I have not and will not profit from the poisoning of innocent children. I continue to work unpaid on their behalf.

You Say You Want a Revolution . . .

Lynn Lyczak is only one example of the new breed of grassroots activists who score the hell out of corporate America. Most commit to a cause after some personal experience drives them to become involved. Typically they act as individuals or as small groups of citizens who have come together to address a local immediate threat to their lives, cities, and neighborhoods. They are often treated with contempt by the professional environmentalists, health advocates, and other public interest organizations headquartered in Washington, DC. Many times they lack organizing expertise and money. They don't have budgets or polished grant proposals needed to obtain funding from foundations and major donors. But corporations and the US government are spending tens of millions of dollars on PR and lobbying to fight these local community activists whom they derisively label NIMBYs—the abbreviation for "Not In My Back Yard."

David Steinman, whose book about pesticide contamination of foods became the target of the stealth PR campaign we describe in Chapter 1, became concerned about what was happening in Lyzback Yard after discovering that his own body was contaminated with abnormal levels of harmful chemicals.

Our chapter about the nuclear industry originated with Judy French, a woman who lives in Las Vegas, Nevada, and has fought for

years to stop nuclear waste from being stored in her backyard. Vegas flick Don Williams, who calls his hired pro-nuke PR campaign the "Keep 'em Honest Coalition," refers to Troschel as a "propagandist and dedicated rock hater" who "has spent much of her adult life screaming that nuclear testing should be banned because it is so terrible." When we spoke with Judy Troschel she didn't screen out. She simply answered our request for information with a well-researched packet of documents that she has spent years tirelessly collecting.

No individual environmental group is fighting the dumping of sewage sludge onto farmland or exposing the risks inherent in the thousands upon thousand families whose health or property may be damaged by toxic sludge. Our heroes for spending their own time and money while enduring personal attacks from government and corporate PR flacks forget the EPA—they're in bed with the sludge industry. The public interest is better served by citizen activists like Lou Beswick of Turlock, California; Jim Byrnes of Laredo, Texas; and Linda Zander of Lynden, Washington.

In our own backyard—Madison, Wisconsin—we've seen plenty of inspiring stories of citizen activists—human beings with normal flaws and foibles who have risen to accomplish extraordinary things. Several years ago a fourth-generation Wisconsin dairy farmer named John Kinsman was sick and getting sicker. His frustrated doctor suggested that perhaps his problem was toxic poisoning. Kinsman stopped using pesticides and switched to older, more proven organic growing methods. His health returned—and his farm grew more profitable as he eliminated the cost of chemicals. He began questioning the ways that commercial and political interests were exploiting farmers. In 1983 Kinsman discovered that Monsanto and other companies were injecting genetically engineered growth hormones into cows to make them produce more milk. He began speaking at the University of Wisconsin to inform students that their favorite processed cheese was made from hormone-treated milk. This simple protest has led to an environmental struggle which is still ongoing to protect the rights of farmers and consumers.

North Madison's localized city suburban united to local issues. During the 1980s Wisconsin's longstanding sister-state relationship with North Carolina came under municipal foreign policy that challenged the federal government's war policy in Central America. Over the years nonprofit groups from around the world started their own sister-city relationships with war-torn Nicaragua's communities. Many

Falkoff, a PR spokesman for US policy, complained that the worst opposition he faced came from "the loony grandmothers of the US who discovered Nicaragua down at my end."¹³

In the 1990s these "loony grandmothers" have proven themselves more persistent and certainly more helpful in their approach to Central American affairs than government experts like Falkoff. Cecile Meyer, for example, is a 71-year-old retired social worker who invests her retirement money in a Madison-based project that offers development loans to low-income Nicaraguan communities. Meyer said she is getting substantial returns—economic ones & those even spiritual ones—states the *National Catholic Reporter*. Meyer is one of a growing number of socially conscious investors from the United States who are aiding reconstruction in postwar Nicaragua through a program called the Nicaraguan Community Development Loan Fund.¹⁴

These examples don't even scratch the surface of the action that is happening at the local level across the United States. A new citizen-led local movement is reclaiming democracy and directly confronting the PR industry's manipulations. The most visible manifestations of NIMBYism—and its biggest success stories, have been in stopping toxic waste sites and toxic recycling incinerators from invading communities. Author Mark Dowie sees this new wave of grassroots democracy as the best hope for realizing the public's well-documented desire for a clean and healthy environment in sustainable balance with nature. "Today grassroots anti-toxic environmentalism is a far more serious threat to polluting industries than the mainstream environmental movement. Not only do local activists network state faires and successfully block many dumpsites and stalled developments, they also stubbornly refuse to surrender or compromise. They simply cannot afford to. Their activities and success are gradually changing the acronym NIMBY to NIABY—Not In Anybody's Backyard."¹⁵

What if everyone became a NIMBY activist? asks author Linda Morris in *Not In My Backyard: The Handbook*, a guide to how your government works—not in theory but in practice. Morris' book does a thorough job of outlining not just the power and potential of NIMBYism but its downsides and difficulties. Like Dowie, she views the current manifestation of NIMBY activism as a starting place for the emergence of a revitalized democracy.

Morris, a long-time veteran of non-profit grassroots citizen organizing, describes how, during the course of a NIMBY campaign, an

understanding of government will be profoundly changed and deepened just as dramatic will be the transformation of your view about how each citizen yourselves included can be part of a larger change.

NIMBY activism is not an obstruction but a stimulus to finding lasting solutions instead of temporary and often devastating technologies. In NIMBY activism people take an active role in shaping their futures and in running their government instead of letting it run them.*

Too Much Democracy?

The term "NIMBY" was originally coined by policy wonks flicks as a term of ridicule but it has become the go-to term. Down notes that

The term was first used literally to suggest that local protectionists' teeth-fairy and no-action ways were so much tooth-millions-of-worse-a solution. It became the term for those who are pre-emptive or reactive. Because of that, and because Associated Press reporter Stephen Wiltshire's definition of the NIMBY as "a person who is afraid of the future." It is the fear of the unknown, of the future, that seems to infect the public. Backing evolution was a difficult task at that time, and now NIMBYs see the threat of evolution. More than anything else, they have learned to be wary of mobs, so too true democracy in America, writes Edward Bernays, is important to the west masses. Because when not equal to everyone else, he pointed that they would eventually turn to authority. In other words, in the NIMBYs view, the future part of the world is unpredictable in his opinion, but it is always being controlled by the ruling government.

This contemptuous attitude toward democracy is the heritage of Edward Bernays, the father of the placebo of public relations who saw corporate engineering engineered consent as a way to dominate the culture in democratic society. Democracy is indeed chaotic, messy and unpredictable, and most bothersome of all to PR practitioners, it often produces decisions that their clients are unable to either predict or control.

The difference between engineered consent and democracy parallels the distinction that Australian scholar Alex Carey draws between propaganda and education. He defines propaganda as communications where the form and content is selected with the single minded purpose of bringing some target audience to adopt attitudes and beliefs chosen in advance by the sponsors of the

communications. With education, by contrast, the purpose is to encourage critical enquiry and to open minds to arguments for and against any particular conclusion, rather than close them to the possibility of any conclusion but one.⁷⁷

The PR professionals who work to manage our opinions and emotions are not doing this because they are evil, but because PR is a financially rewarding business. From their viewpoint they are simply providing a service to their paying customers. If PR poses a threat to democratic values, it is ultimately a manifestation of the deeper contradiction in corporate America—the gap between our dream of governance “by the people, for the people” and the reality of a society deeply divided by unequal access to wealth and power.

As Jerry Mander points out, even enlightened corporate executives are limited in what they can do to implement corporate social responsibility. No corporate manager could ever place community welfare above corporate interest. US corporate law holds that management of publicly held companies must act primarily in the economic interest of shareholders. If not, management can be sued by shareholders and things would surely occur. No managers are legally obliged to ignore community welfare—“if those needs interfere with profitability.”⁷⁸

The absolute power of the bottom line is understood perfectly well by the rather small percentage of Americans who own and manage large businesses. The need to maximize profit drove antifreeze makers to hire a PR spy so they could fight a law that would save children’s lives at a price of only two cents per gallon. Failure to maximize profit is a vital corporate sin. Companies that ignore this law soon learn their lesson when other more profitable companies move in to seize their markets using a combination of lower prices and better advertising.

The voices that dominate our lives today are corporate, not democratic voices. Our system is first and foremost defined by the rules and regulations we follow as employees, customers, and consumers. Public relations firms are themselves corporations which exist to serve the profit-seeking interests of their clients. And as everyone who works for a corporation knows, democracy does not exist at the workplace. Nor is democracy working in Washington and state capitals where corporate special interests control the political process that pit candidates from off and keep them there.

Profoundly exists a need to find a way to the necessary discussions that bring the gap between the dream and the reality of American society

city. In these illusions however the dream remains visible. If the PR industry were *only* based on lies and damn lies, it might be easier to see through its deceptions. But PR's cunning half-truths and spins appeal to us and work on us because they come *from us*. From the constant plumbing of the public mind by surveys, opinion polls, focus groups and information gathered as we apply for bank loans, purchase goods with credit cards, place birth announcements in newspapers, vote, and make phone calls. Every day we as individuals are leaving behind the electronic equivalent of fingerprints and DNA samples that marketing and PR firms lift from the commercial landscape and refine for use in their efforts to manipulate our minds.

Ultimately however the power of PR is limited. It can often redirect public anger and insulate individual corporations or politicians from the consequences of their actions, but as Abraham Lincoln observed, you can't fool all of the people all of the time.

Fortunately corporations are not the only institutions that shape our lives. Families are social enclaves organized according to very different rules than the rules governing corporate behavior. No sane person would propose, for example, that a child's value within a family is based on the child's ability to contribute to the unit's profitability. Other alternatives to corporate dominance can be found in varying forms and degrees in the structures of neighborhoods, churches, volunteer organizations and informal networks of friends—all of which constitute fertile soil for the germination and flowering of NIMBY movements.

We don't pretend to possess a magic solution to the problem that PR poses for our society. In truth any such solution is likely itself to be part of the problem, because real democracy must be the common work and invention of all of us acting together. The solutions we *do* possess are partial: first learn to recognize the influence of PR in your life; second seek out alternative sources of information; third become personally involved in local efforts to directly address important issues at the community level.

The answers, in short, will be found in fellowship with our neighbors and in rediscovery of ourselves. Democracy to be real and contentious must be lived daily, its values woven into the fabric of society. It cannot be handed down or planned from above. Democracy is not like fast food. It can't be standardized, mass produced, made predictable and convenient.

Even rooting in corporate power will not end propaganda and public manipulation; nothing would. Political leaders and vested

interests will always use the most successful techniques available to manipulate human opinion, behavior and public policy in their favor. "Constant vigilance" remains the best watchword for protecting and advancing democracy and for exposing and avoiding PR manipulation.

Wait a Minute—Maybe We've Been Unfair

As you might expect, the PR industry is constantly vigilant about its own image, and the news that we were writing *Toxic Sludge Is Good For You* created some stir in the PR trade press. The June 19, 1995 issue of *PR News* reported that Ron Levy, president of the North American Press Syndicate, questioned whether the intention behind our critical book on PR is to sell copies of the book rather than to present a balanced view of the public relations profession. Levy wrote that there is a "conflict of interest" between our "moral obligation to tell the truth" and our "interest in writing so the book will sell well." To judge whether we have honored this moral obligation, Levy suggested that readers see whether the book "at says only nasty things about the great PR firms" or that presents both sides, including how much good the great PR firms are doing "to save lives, avoid blindness and other health tragedies, and help people get more happiness out of life."¹⁹

Actually, we know this book doesn't tell the "whole story" about public relations. Many PR practitioners are engaged in promotional and publicity campaigns for clinics, schools and deserving charities that benefit the public. The techniques of public relations are not all inherently bad. Everyone at some time uses their skills of persuasion to communicate ideas, sell products, promote a point of view or "schmooze" socially. But positive uses of PR do not in any way mitigate the undemocratic power of the multi-billion dollar PR industry to manipulate and propagandize on behalf of wealthy special interests, dominating debate, discussion and decision making. Nor is it our "moral responsibility" as authors to help the public relations industry clean up its own image which was thoroughly dirty long before we ever set pen to paper. The PR industry is equipped like no other industry on earth to publicize its own good works, and if the public image of PR is negative, it can only be because the industry has failed to honor its own advice, as stated by Ivy Lee: "Set your house in order, then tell the public you have done so."

Citizens and individual PR practitioners can use ethical public relations techniques to right social wrongs, clean up the environment,

promote minority rights, protect working people and make their communities better. But we consider it an illusion to imagine that PR is a "neutral" technology that can simply be adopted methodically to achieve socially responsible ends.

There is a danger in this conceit. All the environmental organizations together will never have a budget for public relations equal to that of even a single major manufacturer of pesticides. The pol-Inter will always be able to outspend and outgan the environmentalists, and can bring virtually an unlimited amount of propagand lobby power to an issue, simply by writing a larger check or reaching out to other businesses similarly threatened by reform.

Another danger is that PR campaigns do not invite individuals to become actors on their own behalf, but treat them as a targeted, passive audience. A democratic movement in the best American tradition must emerge from the initiatives of individual citizens acting as true participants in the process, not as the products of a top-down PR campaign.

Is it possible for such a democratic movement to emerge? Was it ever possible in the past? The very existence of the PR industry proves that it is possible. The fact that corporations and governments feel compelled to spend billions of dollars every year manipulating the public is a perverse tribute to human nature and our own moral values.

The public relations industry has stolen our dreams, and returned them to us packaged as illusions. It must be our duty to dream more deeply and to participate in the process of transforming those dreams into reality.

This book is a project of the Center for Media & Democracy, a public interest organization dedicated to investigative reporting on the PR industry. The Center serves citizens, journalists and researchers. It is funded by other nonprofit groups and individuals, and accepts no government or corporate grants.

For a sample of the Center's quarterly news-magazine, send \$1 to: PR Watch, 3318 Gregory Street, Madison, WI 53711-1725. Phone: (608) 233-3346; e-mail: 74250.735@compuserve.com. Or visit our website: <http://www.prwatch.org>

APPENDIX A

PR Industry LEADERS

In 1995 the world's largest public relations firm was Burson-Marsfelder, followed by Shandwick and Hill & Knowlton. The following information, gleaned from O'Dwyer publications, gives a brief profile of Burson-Marsfelder (B-M) and an idea of its scope.

In 1994 Burson-Marsfelder netted just under \$192 million dollars of income from its 65 offices in 32 countries. Like most transnational firms it has been downsizing its personnel now at 1,700 employees worldwide. The B-M empire has offices in Argentina, Australia, Belgium, Brazil, Canada, Colombia, Chile, Denmark, England, France, Germany, Hong Kong, Hungary, India, Italy, Japan, Korea, Malaysia, Mexico, Netherlands, Norway, People's Republic of China, Poland, Puerto Rico, Russia, Singapore, Slovak Republic, Sweden, Spain, Taiwan, Thailand, and Venezuela.

Burson-Marsfelder purchased the Washington-based public affairs/lobby firms of Gold and Lichtenegger in 1989 and Back Manafort Stone & Kelly in 1991. B-M in turn is part of the privately held Young & Rubicam advertising conglomerate which also owns Cohn & Wolfe and CM&Z, two other major PR firms. In 1993 Young & Rubicam reported billings of more than \$7.5 billion dollars.

Burson-Marsfelder refuses to release a complete list of current and recent clients, but they are known to include major corporations, business associations, government agencies, right-wing political movements, and wealthy individuals such as the Government of El Salvador, NBC, Philip Morris, the Trump Organization, Jonah Sacks, UNITA, Occidental Petroleum, Kazakh American Council, American Airlines, State of Alaska, Commodity Ford Motor Company, The Times Motor Company, MCI, National Restaurant Association, Coca-Cola, Government of Italy, British Columbia's timber industry,

Dow Corning, General Electric, Hydro Quebec, NutraSweet, Government of the Bahamas, AT&T, British Telecom, Chevron, DuPont, IBM, Warner Lambert, Visa, U.S. Postal Service, Seagram, SmithKline Beecham, Reebok, Procter & Gamble, the Olympic Games, Nestle, National Livestock, Motorola, Gerber, Hilti, Caterpillar, American Energy Alliance, State Farm Insurance, Sears, Pfizer, NEC, Metropolitan Life, McDonnell Douglas, Government of Kenya, Government of Indonesia, Glaxo, Campbell Soap, Monsanto, Government of Saudi Arabia, Government of Korea, Bombardier, Sea-Doo, Government of Togo, Government of Nigeria, Beretta USA, Hitachi and many hundreds more.

Burson-Marsteller says its international operations are "linked together electronically and philosophically to deliver a single standard of excellence." It claims that "the role of communications is to manage perceptions which motivate behaviors that create business results. We are totally focused on this idea as our mission. B-MI helps clients manage issues by influencing—in the right combination—public attitudes, public perceptions, public behavior and public policy."

The Top 15 Public Relations Firms In 1994 *(Italics Indicate Advertising Agency Ownership)*

FIRM	Net Fees Millions
1 Burson Marsteller (<i>Young & Rubicam</i>)	\$191.99
2 Shandwick	169.10
3 Hill & Knowlton (<i>WPP Group</i>)	139.40
4 Communications International, Porter Novelli (<i>Omnicom Group</i>)	111.72
5 Edelman PR Worldwide	74.90
6 Fleishman-Hillard	73.89
7 Ketcham PR (<i>Omnicom Group</i>)	55.40
8 Ogilvy Adams & Rinchart (<i>WPP Group</i>)	49.05
9 Robinson Lake Sawyer Miller (<i>Bozell Worldwide</i>)	37.80
10 The Rowland Company (<i>Matchbox Station</i>)	35.00
11 Manning Selvage & Lee (<i>D'Iacq Massey</i>)	31.60
12 GCI Group (<i>Grey Advertising</i>)	31.50
13 Ruder Finn	27.82
14 Financial Relations Board	15.87
15 Cohn & Wolfe (<i>Young & Rubicam</i>)	14.67
TOTAL NET FEE INCOME	\$1.04 billion

APPENDIX B

The Clorox PR Crisis Plan

Today almost every company has in place a "Public Relations Crisis Management Plan" to anticipate and mitigate profit threatening problems, and the Clorox Company is no exception. Chlorine, the active ingredient in its bleach, has been linked to a variety of health problems, including infertility, impaired childhood development, immune system damage, and cancer. Chlorine is also the basis of many persistent compounds including dioxin, Agent Orange herbicides, PCBs, and carbite destroying CFCs.

In 1991, in the face of a mounting campaign by Greenpeace for a global phaseout of chlorine, the Clorox Company turned to Ketchum Public Relations, a premier greenwashing firm. Ketchum's draft plan outlined strategies for dealing with a number of worst case scenarios, but failed to plan for the worst of all possible scenarios—the possibility that some conscientious objector would leak the plan to Greenpeace, which in turn provided it to us.

Below are edited excerpts from Ketchum's proposal to help Clorox present a position that doesn't appear to be self serving—sometimes using a disarming candor other times presenting an understanding business. As corporations gear up for what one leading public relations advisor predicts will be a "weak battle" over the chlorine controversy, the following text reveals the ingenuous scripting behind their "disarming candor."

CRISIS MANAGEMENT PLAN FOR THE CLOROX COMPANY 1991 Draft Prepared by Ketchum Public Relations

The crisis management plan which follows will be used if the Clorox Company needs to be prepared for strategies to address situations flowing from known issues of concern to the public. It is to be emphasized that we have attempted to

provide a crystal ball pinpointing some of the issues which could arise over the next year. For each scenario we have suggested different levels of attention and response.

SCENARIO #1:

Greenpeace activists arrive at Clorox corporate headquarters with signs, banners, bull horns and several local television crews and proceed to launch a rally. The demonstrators hang a large banner. They release the results of a new study linking chlorine exposure to cancer. Two local network affiliates pick up the piece and go live to their noon news with a remote broadcast. AP Radio and the *San Francisco Chronicle* are on the scene and interview three unsuspecting Clorox employees on their way to work, who agree that the safety of chlorine may be in question.

Objective: Make sure this is a one-day media event, with no follow-up stories that results in minimal short-term damage to Clorox's reputation or market position.

Strategies:

- Announce that the company will seek an independent third party review of the Greenpeace study and promise to report back to the media. (The primary goal will be to cause reporters to question Greenpeace's integrity and scientific capabilities.)
- Reporters are invited into the company without Greenpeace for a news conference.
- Team begins alerting key influential scientists, government environmental and health officials, and others previously identified as potential allies.
- Names of independent scientists who will talk about chlorine are given to the media. (These lists are assumed to already be on file as per Master Crisis Plan.)
- Regarding the employees who raised concerns – employee communications efforts will be improved.
- Survey research team begins random telephone survey of 500 consumers to assess the impact of the event. Based on the results available the next morning at 9, team will decide further steps.

SCENARIO #2:

The movement back to more natural household cleaning products is gaining momentum as consumers are actively looking for ways they can contribute to a cleaner planet. A prominent newspaper columnist targets the environmental hazards of liquid chlorine bleach in an article which is syndicated to newspapers across the country. The columnist calls for consumers to boycott Clorox products. Local chapters of Greenpeace take up the cause. A dramatic drop in sales of Clorox products within seven weeks. Congress schedules hearings on the environmental safety of liquid chlorine bleach products.

This event is every company's worst nightmare—the company must be prepared to take aggressive, swift action to protect its brand image, as the very future of the product and the company is at stake.

Objective: Restore Clorox's reputation and that of the product as quickly as possible.

Strategy: Use wherever possible actual rank-and-file employees in their families or as spokespeople to support the company.

- An independent scientist is dispatched to meet with the columnist and discuss the issue.
- Teams of scientists (independent from Clorox or home) are dispatched to conduct media tours.
- Arranging for key media from state and national government leaders and consumer experts to make statements in defense of the product . . .
- Advertising in major markets using Clorox employees and their families who will testify to their faith in the product.
- Advertising campaign—Stop Environmental Terrorism—calling on Greenpeace and the columnists to be more responsible and less militant.
- Video and radio news reports in affected markets.
- Enlist the support of the unions and the national union leadership—**solve jobs are at stake**.
- Determine if and how a slander lawsuit against the columnist and/or Greenpeace could be effective.
- Mass mailings to consumers in affected cities.
- If the situation truly grows desperate, the firm agrees to a caps or a possibility of pulling the product off the market pending a specific review, assuming the review can be done quickly.
- Survey research conducted daily to measure public reaction—beliefs, attitudes, perceptions, etc.

Moderate Case Event: A man by syndicate claim stalks across the United States, threatening to blow up Clorox facilities in the country and to release various toxic substances across the United States. The man has spoken to newspapers in 25 major cities across the U.S. but otherwise goes incognito. A series of questions are put to the syndicate.

Objective: Prevent further damage and get rid of the threat.

Strategy: Keep the public informed but do not prevent them from taking action.

Action Plan:

- Employee announcement is posted.
- Media briefings—positive spin (as long as the threat is slight).
- The company based on the information needs to ban all chlorine bleach.
- Media briefings developed—they key message is that Clorox is safe and safe.

SCENARIO #3:

At least one scientist advisor to the chlorine industry has voiced concern that the National Toxicology Program analysts could conclude that chlorine may possibly be an animal carcinogen. In light of U.S. regulatory policy, a link with cancer could trigger public concern and harsh regulatory action against this important chemical.

Worst Case Event: The final NTP study analysis concludes that chlorine is indeed an animal carcinogen. On the same day of the NTP study announcement, Greenpeace holds a satellite news conference in Washington, New York and San Francisco to launch a concerted campaign to eliminate all use of chlorine in the United States. The news conference receives widespread national media coverage. A number of television reporters use a Clorox bottle to illustrate dangerous products produced with chlorine. The Environmental Protection Agency decides to reevaluate and severely tighten its regulations on the use of chlorine in manufacturing, causing negative media coverage.

Objective: Working with other manufacturers and the Chlorine Institute: (1) forestall any legislative or regulatory action; and (2) Maintain customer and consumer loyalty.

Strategy: Demonstrate company's awareness that people are extremely frightened and have questions that need answers. Be committed to getting those questions answered as quickly as possible and its belief that chlorine does not pose a health hazard to people. While possible, ignore Greenpeace and don't give it credence. Help people understand that Greenpeace is not among the serious players in this issue.

- Through the Chlorine Institute, third party scientific experts are brought to Washington to testify . . .
- Because of advance planning, written material for reporters, customers, consumers and employees is in place with the specific target audiences clearly defined
- Media briefing with key environmental and consumer reporters and with other interested media are held by industry, company and independent spokespersons
- Paid spokespeople are selected for major television and newspaper interviews
- Industry generates grassroots letters to legislators asking them to show that these letters are designed to show that Greenpeace's position is not reflecting widespread consumer concern
- Using the Chlorine Institute website, consumer surveys, direct consumer contacts and meetings and to develop clear consumer messages
- A hotline is established for consumers to call if they have questions

APPENDIX C

SUGGESTED READING

Much of the information that we present in this book appeared originally in a newsmagazine titled *PR Watch* that we edit for the Center for Media & Democracy, a nonprofit organization that monitors the PR industry. A brief box describing the Center appears at the end of page 28. *PR Watch* is published quarterly and is the only publication in the United States devoted to revealing and analyzing PR propaganda and its impact on our lives. For a sample copy send \$1 to *PR Watch* at 3318 Gregory Street, Madison, WI 53711, phone (608) 233-3346.

Fairness & Accuracy In Reporting (FAIR) is a national media watchdog group that focuses awareness on the narrow corporate agenda of the media and its underrepresentation of points of view from women, minorities and low-income groups. It publishes a bimonthly titled *FAIR*. For information contact FAIR, 150 W. 25th Street, New York, NY 10010, (212) 634-6700.

There are a number of professional and trade publications that report on the PR industry—*Inside PR*, *Corporate PR News*, *Public Relations Quarterly*, *PR Tactics*—that are available for fairly steep subscription fees. The editor of *PR Tactics* is of public relations written to be helpful to the PR industry. One trade publishing firm—the Irwin Company of New York—states they believe because of the high degree of digging and reporting done on the industry:

Recently we've had a talk with the CEO of a top ten PR firm who began their friendly get-together by asking "So why does everyone hate you so much?" The answer we believe is that while Irwin's publications provide useful information to the PR industry, Irwin and its associate firms provide journalists with what we feel has been the best information available to step on the PR industry's standards and criticize the industry.

If you need to track the PR industry on a regular basis we recommend subscribing to one or more of the Irwin publications. The *Indus* (Irwin's PR Services), *Public Relations Newsletter*, weekly *Irwin's Watchdog Report* (a weekly), and the annual *Irwin's*

Directory of Public Relations Firms. For subscription information contact Jack O'Dwyer, 271 Madison Ave., NY, NY 10016, phone (212) 679-2177.

Do you need to know which PR firm or lobbyist is representing whom in Washington, or whether the Coalition for Health Insurance Choices is an insurance industry front group? Then you should probably get the best annual directory to the action inside the Beltway: *Washington Representatives: Who Does What for Whom in the Nation's Capital*. Common Books Inc., 1212 New York Avenue, Washington, DC 20005, phone 202/898-0002.

Another useful resource published in 1995 by the nonprofit Advocacy Institute is titled *By Hook or By Crook: A Guide to Stealth Lobbying Tactics and Counter Strategies*. Their address is 1717 L Street NW, Suite 600, Washington, DC 20006, phone (202) 350-8175.

To understand how the PR model works and what sort of tactics and strategies are the tools of the trade we recommend a simple short-text book written for PR students titled *Marketing Public Relations: The Tools That Make It Work* by René A. Henry Jr. (1995, Iowa State University Press).

Another avenue is right-wing free-world publicists whose clients include Michael Jackson and Clinton Heston. While we don't concur with his philosophy, we do recommend his book *Cannibal PR* (1993, HarperCollins, NY), as surely, how to guide citizens looking for inexpensive creative ways to publicize and promote their own causes.

2. Ibid. p. 50.
3. Ibid. p. 60.
4. Scott Cutlip, *The Unseen Power: Public Relations: A History* (Hillsdale, NJ: Lawrence Erlbaum Associates, Inc., 1994), p. 51. For a description of press agency in the early twentieth century see Neal Gabler, *Winchell Power and the Culture of Celebrity*, excerpted in O'Dwyer's PR Services Report Dec. 1994, pp. 24-25.
5. Bill Irwin, "Press Agent: His Rise and Fall," *Collier's* Vol. 48, Dec. 2, 1991. Quoted in Cutlip, p. 51.

Reed, W. J. *The Tobacco War*. New York: Harper & Row, 1971.

Rosen, M. *Smoking: An Advertising Art*. New York: The International Museum of Advertising, 1970.

Schlesinger, H. L. *What Every Executive Should Know About Politics*. New York: McGraw-Hill, 1963.

Shrivastava, P. *Green Politics*. London: Tavistock, 1980.

Stevens, J. *How to Win Friends and Influence People*. New York: Simon & Schuster, 1936.

Chapter 2: *Marketing*, pp. 7-9.

Chapter 3: *Politics*, pp. 10-12.

Chapter 4: *Health*, pp. 13-15.

Chapter 5: *Science*, pp. 16-18.

Chapter 6: *Media*, pp. 19-21.

Chapter 7: *Environment*, pp. 22-24.

Chapter 8: *Health*, pp. 25-27.

Chapter 9: *Science*, pp. 28-30.

Chapter 10: *Media*, pp. 31-33.

Chapter 11: *Environment*, pp. 34-36.

Chapter 12: *Health*, pp. 37-39.

Chapter 13: *Science*, pp. 40-42.

Chapter 14: *Media*, pp. 43-45.

Chapter 15: *Environment*, pp. 46-48.

Chapter 16: *Health*, pp. 49-51.

Chapter 17: *Science*, pp. 52-54.

Chapter 18: *Media*, pp. 55-57.

Chapter 19: *Environment*, pp. 58-60.

Chapter 20: *Health*, pp. 61-63.

Chapter 21: *Science*, pp. 64-66.

Chapter 22: *Media*, pp. 67-69.

Chapter 23: *Environment*, pp. 70-72.

Chapter 24: *Health*, pp. 73-75.

Chapter 25: *Science*, pp. 76-78.

Chapter 26: *Media*, pp. 79-81.

Chapter 27: *Environment*, pp. 82-84.

Chapter 28: *Health*, pp. 85-87.

Chapter 29: *Science*, pp. 88-90.

Chapter 30: *Media*, pp. 91-93.

Chapter 31: *Environment*, pp. 94-96.

Chapter 32: *Health*, pp. 97-99.

Chapter 33: *Science*, pp. 100-102.

Chapter 34: *Media*, pp. 103-105.

Chapter 35: *Environment*, pp. 106-108.

Chapter 36: *Health*, pp. 109-111.

Chapter 37: *Science*, pp. 112-114.

Chapter 38: *Media*, pp. 115-117.

Chapter 39: *Environment*, pp. 118-120.

Chapter 40: *Health*, pp. 121-123.

Chapter 41: *Science*, pp. 124-126.

Chapter 42: *Media*, pp. 127-129.

Chapter 43: *Environment*, pp. 130-132.

Chapter 44: *Health*, pp. 133-135.

Chapter 45: *Science*, pp. 136-138.

Chapter 46: *Media*, pp. 139-141.

Chapter 47: *Environment*, pp. 142-144.

Chapter 48: *Health*, pp. 145-147.

Chapter 49: *Science*, pp. 148-150.

Chapter 50: *Media*, pp. 151-153.

Chapter 51: *Environment*, pp. 154-156.

Chapter 52: *Health*, pp. 157-159.

Chapter 53: *Science*, pp. 160-162.

Chapter 54: *Media*, pp. 163-165.

Chapter 55: *Environment*, pp. 166-168.

Chapter 56: *Health*, pp. 169-171.

Chapter 57: *Science*, pp. 172-174.

Chapter 58: *Media*, pp. 175-177.

Chapter 59: *Environment*, pp. 178-180.

Chapter 60: *Health*, pp. 181-183.

Chapter 61: *Science*, pp. 184-186.

Chapter 62: *Media*, pp. 187-189.

Chapter 63: *Environment*, pp. 190-192.

Chapter 64: *Health*, pp. 193-195.

Chapter 65: *Science*, pp. 196-198.

Chapter 66: *Media*, pp. 199-201.

Chapter 67: *Environment*, pp. 202-204.

Chapter 68: *Health*, pp. 205-207.

Chapter 69: *Science*, pp. 208-210.

Chapter 70: *Media*, pp. 211-213.

Chapter 71: *Environment*, pp. 214-216.

Chapter 72: *Health*, pp. 217-219.

Chapter 73: *Science*, pp. 220-222.

Chapter 74: *Media*, pp. 223-225.

Chapter 75: *Environment*, pp. 226-228.

Chapter 76: *Health*, pp. 229-231.

Chapter 77: *Science*, pp. 232-234.

Chapter 78: *Media*, pp. 235-237.

Chapter 79: *Environment*, pp. 238-240.

Chapter 80: *Health*, pp. 241-243.

Chapter 81: *Science*, pp. 244-246.

Chapter 82: *Media*, pp. 247-249.

Chapter 83: *Environment*, pp. 250-252.

Chapter 84: *Health*, pp. 253-255.

Chapter 85: *Science*, pp. 256-258.

Chapter 86: *Media*, pp. 259-261.

Chapter 87: *Environment*, pp. 262-264.

Chapter 88: *Health*, pp. 265-267.

Chapter 89: *Science*, pp. 268-270.

Chapter 90: *Media*, pp. 271-273.

Chapter 91: *Environment*, pp. 274-276.

Chapter 92: *Health*, pp. 277-279.

Chapter 93: *Science*, pp. 280-282.

Chapter 94: *Media*, pp. 283-285.

Chapter 95: *Environment*, pp. 286-288.

Chapter 96: *Health*, pp. 289-291.

Chapter 97: *Science*, pp. 292-294.

Chapter 98: *Media*, pp. 295-297.

Chapter 99: *Environment*, pp. 298-300.

Chapter 100: *Health*, pp. 301-303.

Chapter 101: *Science*, pp. 304-306.

Chapter 102: *Media*, pp. 307-309.

Chapter 103: *Environment*, pp. 310-312.

Chapter 104: *Health*, pp. 313-315.

Chapter 105: *Science*, pp. 316-318.

Chapter 106: *Media*, pp. 319-321.

Chapter 107: *Environment*, pp. 322-324.

Chapter 108: *Health*, pp. 325-327.

Chapter 109: *Science*, pp. 328-330.

Chapter 110: *Media*, pp. 331-333.

Chapter 111: *Environment*, pp. 334-336.

Chapter 112: *Health*, pp. 337-339.

Chapter 113: *Science*, pp. 340-342.

Chapter 114: *Media*, pp. 343-345.

Chapter 115: *Environment*, pp. 346-348.

Chapter 116: *Health*, pp. 349-351.

Chapter 117: *Science*, pp. 352-354.

Chapter 118: *Media*, pp. 355-357.

Chapter 119: *Environment*, pp. 358-360.

Chapter 120: *Health*, pp. 361-363.

Chapter 121: *Science*, pp. 364-366.

Chapter 122: *Media*, pp. 367-369.

Chapter 123: *Environment*, pp. 370-372.

Chapter 124: *Health*, pp. 373-375.

Chapter 125: *Science*, pp. 376-378.

Chapter 126: *Media*, pp. 379-381.

Chapter 127: *Environment*, pp. 382-384.

Chapter 128: *Health*, pp. 385-387.

Chapter 129: *Science*, pp. 388-390.

Chapter 130: *Media*, pp. 391-393.

Chapter 131: *Environment*, pp. 394-396.

Chapter 132: *Health*, pp. 397-399.

Chapter 133: *Science*, pp. 400-402.

Chapter 134: *Media*, pp. 403-405.

Chapter 135: *Environment*, pp. 406-408.

Chapter 136: *Health*, pp. 409-411.

Chapter 137: *Science*, pp. 412-414.

Chapter 138: *Media*, pp. 415-417.

Chapter 139: *Environment*, pp. 418-420.

Chapter 140: *Health*, pp. 421-423.

Chapter 141: *Science*, pp. 424-426.

Chapter 142: *Media*, pp. 427-429.

Chapter 143: *Environment*, pp. 430-432.

Chapter 144: *Health*, pp. 433-435.

Chapter 145: *Science*, pp. 436-438.

Chapter 146: *Media*, pp. 439-441.

Chapter 147: *Environment*, pp. 442-444.

Chapter 148: *Health*, pp. 445-447.

Chapter 149: *Science*, pp. 448-450.

Chapter 150: *Media*, pp. 451-453.

Chapter 151: *Environment*, pp. 454-456.

Chapter 152: *Health*, pp. 457-459.

Chapter 153: *Science*, pp. 460-462.

Chapter 154: *Media*, pp. 463-465.

Chapter 155: *Environment*, pp. 466-468.

Chapter 156: *Health*, pp. 469-471.

Chapter 157: *Science*, pp. 472-474.

Chapter 158: *Media*, pp. 475-477.

Chapter 159: *Environment*, pp. 478-480.

Chapter 160: *Health*, pp. 481-483.

Chapter 161: *Science*, pp. 484-486.

Chapter 162: *Media*, pp. 487-489.

Chapter 163: *Environment*, pp. 490-492.

Chapter 164: *Health*, pp. 493-495.

Chapter 165: *Science*, pp. 496-498.

Chapter 166: *Media*, pp. 499-501.

Chapter 167: *Environment*, pp. 502-504.

Chapter 168: *Health*, pp. 505-507.

Chapter 169: *Science*, pp. 508-510.

Chapter 170: *Media*, pp. 511-513.

Chapter 171: *Environment*, pp. 514-516.

Chapter 172: *Health*, pp. 517-519.

Chapter 173: *Science*, pp. 520-522.

Chapter 174: *Media*, pp. 523-525.

Chapter 175: *Environment*, pp. 526-528.

Chapter 176: *Health*, pp. 529-531.

Chapter 177: *Science*, pp. 532-534.

Chapter 178: *Media*, pp. 535-537.

Chapter 179: *Environment*, pp. 538-540.

Chapter 180: *Health*, pp. 541-543.

Chapter 181: *Science*, pp. 544-546.

Chapter 182: *Media*, pp. 547-549.

Chapter 183: *Environment*, pp. 550-552.

Chapter 184: *Health*, pp. 553-555.

Chapter 185: *Science*, pp. 556-558.

Chapter 186: *Media*, pp. 559-561.

Chapter 187: *Environment*, pp. 562-564.

Chapter 188: *Health*, pp. 565-567.

Chapter 189: *Science*, pp. 568-570.

Chapter 190: *Media*, pp. 571-573.

Chapter 191: *Environment*, pp. 574-576.

Chapter 192: *Health*, pp. 577-579.

Chapter 193: *Science*, pp. 580-582.

Chapter 194: *Media*, pp. 583-585.

Chapter 195: *Environment*, pp. 586-588.

Chapter 196: *Health*, pp. 589-591.

Chapter 197: *Science*, pp. 592-594.

Chapter 198: *Media*, pp. 595-597.

Chapter 199: *Environment*, pp. 598-600.

Chapter 200: *Health*, pp. 601-603.

Chapter 201: *Science*, pp. 604-606.

Chapter 202: *Media*, pp. 607-609.

Chapter 203: *Environment*, pp. 610-612.

Chapter 204: *Health*, pp. 613-615.

Chapter 205: *Science*, pp. 616-618.

Chapter 206: *Media*, pp. 619-621.

Chapter 207: *Environment*, pp. 622-624.

Chapter 208: *Health*, pp. 625-627.

Chapter 209: *Science*, pp. 628-630.

Chapter 210: *Media*, pp. 631-633.

Chapter 211: *Environment*, pp. 634-636.

Chapter 212: *Health*, pp. 637-639.

Chapter 213: *Science*, pp. 640-642.

Chapter 214: *Media*, pp. 643-645.

Chapter 215: *Environment*, pp. 646-648.

Chapter 216: *Health*, pp. 649-651.

Chapter 217: *Science*, pp. 652-654.

Chapter 218: *Media*, pp. 655-657.

Chapter 219: *Environment*, pp. 658-660.

Chapter 220: *Health*, pp. 661-663.

Chapter 221: *Science*, pp. 664-666.

Chapter 222: *Media*, pp. 667-669.

Chapter 223: *Environment*, pp. 670-672.

Chapter 224: *Health*, pp. 673-675.

Chapter 225: *Science*, pp. 676-678.

Chapter 226: *Media*, pp. 679-681.

Chapter 227: *Environment*, pp. 682-684.

Chapter 228: *Health*, pp. 685-687.

Chapter 229: *Science*, pp. 688-690.

Chapter 230: *Media*, pp. 691-693.

Chapter 231: *Environment*, pp. 694-696.

Chapter 232: *Health*, pp. 697-699.

Chapter 233: *Science*, pp. 700-702.

Chapter 234: *Media*, pp. 703-705.

Chapter 235: *Environment*, pp. 706-708.

Chapter 236: *Health*, pp. 709-711.

Chapter 237: *Science*, pp. 712-714.

Chapter 238: *Media*, pp. 715-717.

Chapter 239: *Environment*, pp. 718-720.

Chapter 240: *Health*, pp. 721-723.

Chapter 241: *Science*, pp. 724-726.

Chapter 242: *Media*, pp. 727-729.

Chapter 243: *Environment*, pp. 730-732.

Chapter 244: *Health*, pp. 733-735.

Chapter 245: *Science*, pp. 736-738.

Chapter 246: *Media*, pp. 739-741.

Chapter 247: *Environment*, pp. 742-744.

Chapter 248: *Health*, pp. 745-747.

Chapter 249: *Science*, pp. 748-750.

Chapter 250: *Media*, pp. 751-753.

Chapter 251: *Environment*, pp. 754-756.

Chapter 252: *Health*, pp. 757-759.

Chapter 253: *Science*, pp. 760-762.

Chapter 254: *Media*, pp. 763-765.

Chapter 255: *Environment*, pp. 766-768.

Chapter 256: *Health*, pp. 769-771.

Chapter 257: *Science*, pp. 772-774.

Chapter 258: *Media*, pp. 775-777.

Chapter 259: *Environment*, pp. 778-780.

Chapter 260: *Health*, pp. 781-783.

Chapter 261: *Science*, pp. 784-786.

Chapter 262: *Media*, pp. 787-789.

Chapter 263: *Environment*, pp. 790-792.

Chapter 264: *Health*, pp. 793-795.

Chapter 265: *Science*, pp. 796-798.

Chapter 266: *Media*, pp. 799-801.

Chapter 267: *Environment*, pp. 802-804.

Chapter 268: *Health*, pp. 805-807.

Chapter 269: *Science*, pp. 808-810.

Chapter 270: *Media*, pp. 811-813.

Chapter 271: *Environment*, pp. 814-816.

Chapter 272: *Health*, pp. 817-819.

Chapter 273: *Science*, pp. 820-822.

Chapter 274: *Media*, pp. 823-825.

Chapter 275: *Environment*, pp. 826-828.

Chapter 276: *Health*, pp. 829-831.

Chapter 277: *Science*, pp. 832-834.

Chapter 278: *Media*, pp. 835-837.

Chapter 279: *Environment*, pp. 838-840.

Chapter 280: *Health*, pp. 841-843.

Chapter 281: *Science*, pp. 844-846.

Chapter 282: *Media*, pp. 847-849.

Chapter 283: *Environment*, pp. 850-852.

Chapter 284: *Health*, pp. 853-855.

Chapter 285: *Science*, pp. 856-858.

Chapter 286: *Media*, pp. 859-861.

Chapter 287: *Environment*, pp. 862-864.

Chapter 288: *Health*, pp. 865-867.

Chapter 289: *Science*, pp. 868-870.

Chapter 290: *Media*, pp. 871-873.

Chapter 291: *Environment*, pp. 874-876.

Chapter 292: *Health*, pp. 877-879.

Chapter 293: *Science*, pp. 880-882.

Chapter 294: *Media*, pp. 883-885.

Chapter 295: *Environment*, pp. 886-888.

Chapter 296: *Health*, pp. 889-891.

Chapter 297: *Science*, pp. 892-894.

Chapter 298: *Media*, pp. 895-897.

Chapter 299: *Environment*, pp. 898-900.

Chapter 300: *Health*, pp. 901-903.

Chapter 301: *Science*, pp. 904-906.

Chapter 302: *Media*, pp. 907-909.

Chapter 303: *Environment*, pp. 910-912.

Chapter 304: *Health*, pp. 913-915.

Chapter 305: *Science*, pp. 916-918.

Chapter 306: *Media*, pp. 919-921.

Chapter 307: *Environment*, pp. 922-924.

Chapter 308: *Health*, pp. 925-927.

Chapter 309: *Science*, pp. 928-930.

Chapter 310: *Media*, pp. 931-933.

Chapter 311: *Environment*, pp. 934-936.

Chapter 312: *Health*, pp. 937-939.

Chapter 313: *Science*, pp. 940-942.

Chapter 314: *Media*, pp. 943-945.

Chapter 315: *Environment*, pp. 946-948.

Chapter 316: *Health*, pp. 949-951.

Chapter 317: *Science*, pp. 952-954.

Chapter 318: *Media*, pp. 955-957.

Chapter 319: *Environment*, pp. 958-960.

Chapter 320: *Health*, pp. 961-963.

Chapter 321: *Science*, pp. 964-966.

Chapter 322: *Media*, pp. 967-969.

Chapter 323: *Environment*, pp. 970-972.

Chapter 324: *Health*, pp. 973-975.

Chapter 325: *Science*, pp. 976-978.

Chapter 326: *Media*, pp. 979-981.

Chapter 327: *Environment*, pp. 982-984.

Chapter 328: *Health*, pp. 985-987.

Chapter 329: *Science*, pp. 988-990.

Chapter 330: *Media*, pp. 991-993.

Chapter 331: *Environment*, pp. 994-996.

Chapter 332: *Health*, pp. 997-999.

Chapter 333: *Science*, pp. 1000-1002.

Chapter 334: *Media*, pp. 1003-1005.

Chapter 335: *Environment*, pp. 1006-1008.

Chapter 336: *Health*, pp. 1009-1011.

Chapter 337: *Science*, pp. 1012-1014.

Chapter 338: *Media*, pp. 1015-1017.

Chapter 339: *Environment*, pp. 1018-1020.

Chapter 340: *Health*, pp. 1021-1023.

Chapter 341: *Science*, pp. 1024-1026.

Chapter 342: *Media*, pp. 1027-1029.

Chapter 343: *Environment*, pp. 1030-1032.

Chapter 344: *Health*, pp. 1033-1035.

Chapter 345: *Science*, pp. 1036-1038.

Chapter 346: *Media*, pp. 1039-1041.

Chapter 347: *Environment*, pp. 1042-1044.

Chapter 348: *Health*, pp. 1045-1047.

Chapter 349: *Science*, pp. 1048-1050.

Chapter 350: *Media*, pp. 1051-1053.

Chapter 351: *Environment*, pp. 1054-1056.

Chapter 352: *Health*, pp. 1057-1059.

Chapter 353: *Science*, pp. 1060-1062.

Chapter 354: *Media*, pp. 1063-1065.

Chapter 355: *Environment*, pp. 1066-1068.

Chapter 356: *Health*, pp. 1069-1071.

Chapter 357: *Science*, pp. 1072-1074.

Chapter 358: *Media*, pp. 1075-1077.

Chapter 359: *Environment*, pp. 1078-1080.

Chapter 360: *Health*, pp. 1081-1083.

Chapter 361: *Science*, pp. 1084-1086.

True Justice Is Good For You blows the lid off today's multi-billion-dollar propaganda-for-hire industry. This book names names and reveals how public relations wizards concoct and spin the news, organize phony "grass-roots" front groups, spy on citizens, and conspire with lobbyists and political clients to thwart democracy.

Your worst cynicism pales before reality in this blistering and often hilarious exposé of secretive, little-known mega-firms such as Hill & Knowlton, Burson Marsteller and Ketchum PR—the "invisible men" who control our political debates and public opinion, twisting reality and protecting the powerful from scrutiny.

"Scarier than anything by Stephen King."

—Martin Tartel, author, *Rain Forest in Your Kitchen*

"A well-written, enlightening look at a war of the powerful against society."

—Edward Herman, co-author, *Manufacturing Consent*

"Helps us see corporate crime and media distortion up close."

—Jeff Cohen, executive director, FAIR

"Important . . . unmasks how corporations manipulate our democracy."

—William Greider, author, *Who Will Tell The People*

"Explores how far we've tumbled down the dark hole of Newspeak that

Orwell warned about . . . It could be the flashlight to find our way out."

—Jim Hightower, author, talk show host

"Captivating . . . reveals the sordid truth behind the lies that undermine democracy. Buy. Read. Organize."

—Harriet Barlow, director, Blue Mountain Center

"The best work ever on the PR industry. Required reading."

—Robert McChesney, author,
Telecommunications, Mass Media & Democracy

"Powerful."

—Ben H. Bagdikian, author, *The Media Monopoly*

John C. Stauber is founder and director of the Center for Media & Democracy. He and Sheldon Rampton write and edit the quarterly *PR Watch: Public Interest Reporting on the PR/Public Affairs Industry*. They live in Madison, Wisconsin.
